It's Their Time But It's Your Money

The moment one of your men continues working after a file has become dull you lose money, because the man will waste more time with the dull file than a new one would cost.

Teach them to turn in a file as soon as it becomes dull and get a new one. And specify the standard *Famous Five* Files when ordering.

Why use makeshifts?

WHY waste time and energy with makeshift devices for boring operations when Williams' "Agrippa" Adjustable Boring-Tool Posts offer convenience and efficiency developed to the nth power?

Each post accommodates a wide range of Bars, the height of which is readily adjusted; a turn of the Knurled Ring raises or lowers the base on which they rest. The whole device is instantly and rigidly locked by tightening the Set Screw.

Four sizes for ½ to 2¼" diameter Bars—furnished with or without Bars.

Ask for Machinists' Tools Booklet.

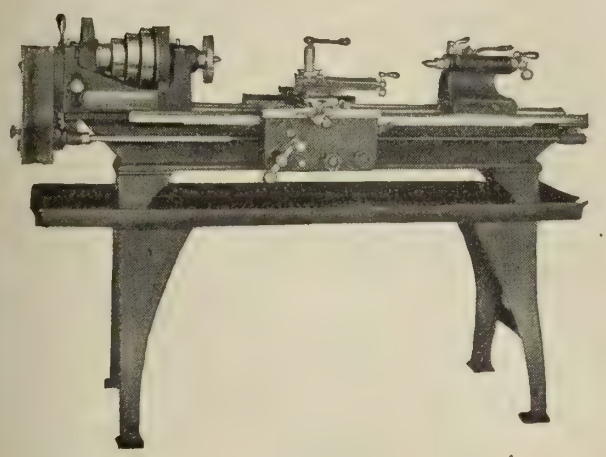
"STAR" Screw Cutting Engine LATHES

For Experimental Shops For Manual Training



WHEN figuring on new equipment for the manual training section in technical schools, one should investigate our line of small lathes.

They are *accurate, rigid* and *economical,* and can do the work of heavier, more costly equipment on light manufacturing and repair work.

Users of "Star" lathes remark on their simplicity of operation.

"Star" lathes are built in 9, 11, 12 and 13 inch sizes.

Write for the "Star" lathe catalog.

INC.
366 W. Falls Street Seneca Falls, N.Y.

SUPERIOR DESIGN

LANDIS

BORING, MILLING AND DRILLING MACHINE

"This is the best designed and best built Boring Machine I have ever seen."

This is the comment of one of America's foremost machine tool manufacturers upon examining the new LANDIS Boring, Milling and Drilling Machine.

Users invariably agree with this opinion. The LANDIS Boring Machine has already laid the foundation for the same world-wide reputation for merit that its brother, the LANDIS Grinding Machine, enjoys.

SERVICE

and "THE COVENTRY" Chains are synonymous terms. This is attained by correct design, the use of special analysis steel, first-class workmanship and a rigid system of examination.

These, combined with a determination to produce only the best, give that steady, continuous service which is an essential feature of "THE COVENTRY" Chains.

The same service is at your disposal. If you wish to instal the most efficient form of Power Transmission, our Technical Staff will gladly give you all the assistance needed, without obligation, and without prejudice to any particular form of drive.

KEMPSMITH No. 4 Plain Maximiller

Single Pulley Drive

Equipment—1¾ inch arbor, two arbor supports, brac›, No. 4 Plain Vise and all necessary crank handles, wrenches, and accessories as shown.

The Kempsmith No. 4 Plain Maximiller has been de igned in recognition of the growing demand for a heavier and more powerful machine than the usual cone type m ller. It is the product of some twelve years' experimentation by an experienced and thoroughly seasoned or anization. In all features of general design, such as weight, rigidity, convenience of operation and efficiency in production we offer this machine as the maximum milling machine of similar rating.

No expense has been spared to incorporate the very h ghest class of materials obtainable. All gearing stock is purchased to exact chemical analysis and is scienti ically heat treated for the particular use to which it is put. Much of the shafting especially that in the speed rain is also heat treated alloy steel.

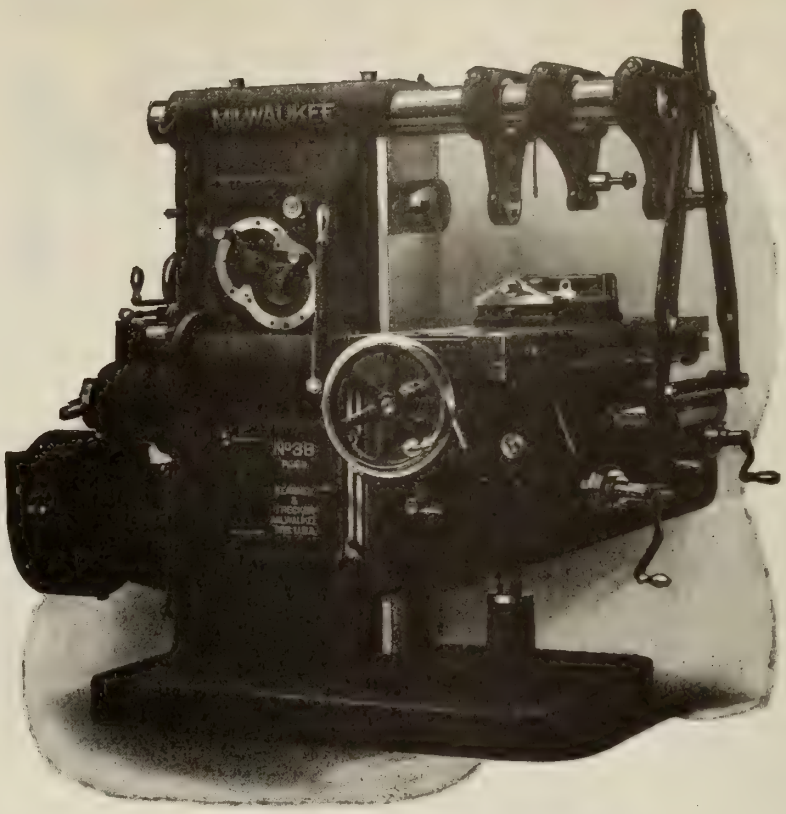
Entered as second-class matter at the Post Office Department, Ottawa, Canada. Entered as second-class matter July 1, 1912, at the Post Office at Buffalo, under the Act of March 3rd, 1879.



MILWAUKEE MILLING MACHINES

Double Overarm maintains alignment.

It is impossible for the operator to place the arbor supports on the arbor and double overarm in any other way than in line. Arbor cannot be pounded out of line when using large, coarse pitch cutters on rough, heavy work.

Other Distinctive Milwaukee Features:

Solid top knee—hardened steel gearing and shafts in the column and feed box—automatic flooded lubrication — one and one-half gallons of oil per minute pouring over all gears and bearings in the column and feed box, insuring lubrication at all times—flanged spindle with hardened steel collar for driving arbors—constant speed drive, reverse being self-contained.

Send for our No. 21 Catalogue. Illustrating and describing Milwaukee Milling Machines and accessories in detail

ANNOUNCEMENT

THE ALGOMA STEEL CORPORATION, LIMITED, take pleasure in announcing to their customers and the Canadian trade that in accordance with the widespread desire throughout the Dominion that there should be obtained in Canada with Canadian labor, a much larger proportion of the requirements of this country in STEEL SECTIONS for STRUCTURAL PURPOSES, CAR CONSTRUCTION, SHIPBUILDERS' REQUIREMENTS, etc., they are just completing extensive alterations and additions to their rolling mills, and on or about 1ST NOVEMBER, will be ready to produce and ship American Standard Sections of BEAMS and CHANNELS up to and including 15", all standard sections of ANGLES from 6" x 6" down to 1¼" x 1¼", ZEE BARS for car builders and general purposes, small and large ROUNDS and SQUARES, and FLAT BARS up to 14" wide. The quality of the product is already well known to the trade, and is exclusively steel made by the Open Hearth process. and can be furnished in all grades from the softest rivet stock to high carbon special spring material.

The following are the sections which will be rolled:---

ANGLES—Equal Leg—
6 x 6"—5 x 5"—4 x 4"
3½ x 3½"—3 x 3"
2½ x 2½"—2¼ x 2¼"
2 x 2"—1¾ x 1¾"
1½ x 1½"—1¼ x 1¼"

ANGLES—Unequal Leg—
6 x 4"—6 x 3½"—5 x 4"
5 x 3½"—5 x 3"—4½ x 3"
4 x 3½"—4 x 3"—3½ x 3"
3½ x 2½"—3 x 2½"—3 x 2"
2½ x 2"

BEAMS—
15", 12", 10", 8", 6", 5", 4", 3".

CHANNELS—
15", 13", 12", 10", 8", 6", 5", 4", 3".

ZEES—
3¼ x 5 x 3¼ x 5/16
3 5/16 x 5 1/16 x 3 5/16 x ⅜"
3⅜ x 5⅛ x 3⅜ x 7/16"
3 1/16 x 4 x 3 1/16 x ¼"
3⅛ x 4 1/16 x 3⅛ x 5/16"
3 3/16 x 4⅛ x 3 3/16 x ⅜"
2 11/16 x 3 x 2 11/16 x ¼"
2¾ x 3 1/16 x 2¾ x 5/16"

ROUNDS—
All sizes from ½" up to and including 4".

SQUARES—
All sizes from ½" up to and including 3".

FLATS—
All sizes from 1 x ¼" up to and including 14" wide.

MINE RAILS—
All sections from 12 lbs. up to and including 45 lbs. per yard.

PIG IRON—
Machine cast FOUNDRY MALLEABLE and BASIC.

SULPHATE OF AMMONIA.
NITRE CAKE.

For the better convenience of customers who may find it necessary to secure rush shipments of particular items, they contemplate keeping a large stock of all the various standard sections constantly on hand, and to this end extensive warehouse facilities are being prepared.
Your enquiries and business will be appreciated.

OUR AIR COMPRESSORS ARE ACCESSIBLE

One of the most important points about an air compressor is that it should be so built that inspection and cleaning can be done with the least amount of trouble. The horizontal type of construction which we have adopted is particularly handy—cylinder, valves, etc., are readily accessible; crossheads and guides can be inspected and cleaned without unscrewing bolts and removing plates; and the crank, etc., are available for inspection simply by lifting off a cover.

Write for our compressor bulletins for further information.

Do Your Castings Cost Too Much?

A rearrangement of your patterns might cut their cost 25%; a different method of molding them might double your production at no increase in molding cost. **We can advise you** and we have expert metal and wood pattern-makers who are able to make any changes that may commend themselves to you.

If you need some new Patterns

send us a sample, blueprint or sketch, and ask for our advice. It won't cost you anything. If our advice is good and commends itself to you, it is only fair to assume that our work will be equally satisfactory, and we need the work as badly as you need the patterns.

We are in a position to do turning, boring, drilling or other semi-finishing operations on castings supplied by us.

The Canadian Disc Sander is 90% Dustless

Think what a godsend that is to the pattern shop! Hundreds of prominent concerns are profiting immensely by using these sanders.

Two types of Canadian sanders are built—the Disc Sander and the Oscillating Spindle Sander. Both machines are equipped with New Departure ball bearings and General Electric motor. The table in each case can be tilted by a hand adjustment, 45 degrees down or 15 degrees up. Power is obtained by plugging into a lamp socket. Canadian Sanders are extraordinarily well built and are guaranteed against all defects.

Unloading Cars of Castings Speedily with a Link-Belt Locomotive Crane equipped with Lifting Magnet.

Speed Up Your Unloading with a Link-Belt Locomotive Crane

NO matter what kind of materials or products you load and unload, or handle around your yard, a Link-Belt Locomotive Crane will do the work quickly and at a low cost.

A crane is a great labor-saver. It is a reliable machine which can be kept on the job every day, and can be depended upon for reliable service.

Equipped with a grab bucket it will unload and store coal; fitted with a hook block it can handle miscellaneous loads of any kind, and with the electric lifting magnet attachment as shown in the illustration it can handle iron and steel, scrap, etc.

Let our experienced engineers look over your present handling methods and make recommendations. Catalog No. 370 on request.

The Man That Does The Work

Employers of labor are giving more time and sympathy to the mechanic's view of the job.

Men enjoy working with up-to-date, "no fuss" tools and equipment.

The largest, prosperous, most efficient factories in the world have installed Jacobs Improved Drill Chucks to aid their workmen and conserve their energy, time and temper.

Their 16 years of continuous and ever-growing service have made them the dominant chucks where reputation must be built on operation.

Made in 6 different models in 12 styles ranging from 13/64″ to 1″.

THE JACOBS MFG. CO.
Dept. C.M.
HARTFORD — CONN.

Jacobs Chucks

The toolmaker says:

"Yes, I've got quite a number. No more, probably, than most toolmakers, but quite a number just the same. But then, I ought to have a lot of 'em. I've been buying Starrett Tools ever since I was an apprentice.

"You know my work calls for pretty close limits, and some way or other I've got a feeling of confidence in Starrett Tools that makes it easier for me to do good work.

"When did I get my first Starrett Tool? Oh, somewhere back in the 80's. In fact, it must have been pretty soon after the Starrett factory started. There's one thing that always impressed me. Right from the start, Starrett Tools have been designed and made by men who knew machine shop practice. You know, practical men. And somehow it shows in the quality of the tools."

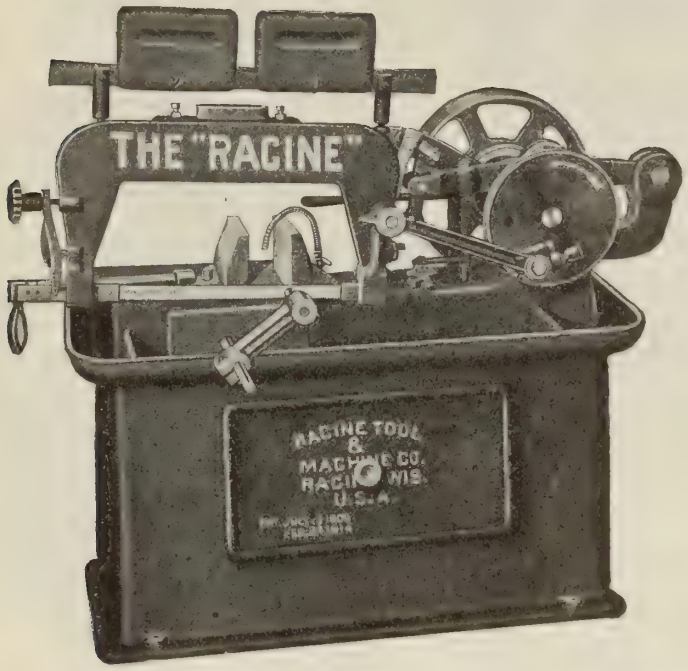
Standard the World Over

"THE RACINE"



HIGH SPEED METAL CUTTING MACHINE

Reduces Blade Expense

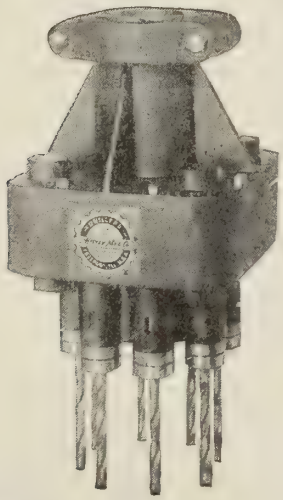
Aside from its ability to turn out more work than any other metal cutting machine, "THE RACINE" will save you considerable money on blades alone—enough to pay for itself in a reasonable time. The automatic lifting device is responsible for that. It automatically raises the blade on the return stroke, relieving it of all dragging or strain. This also means quicker cutting, less power used and greater production.

There are many ways "THE RACINE" will prove a big saving. Let us tell them to you.

Use "Racine" H.S. Tungsten Power Blades

Racine Tool & Machine Co.
Melbourne Avenue, - RACINE, WIS. U.S.A.

2 Minutes or 20?



This Is The Vital Question

Do you drill ten holes in the time it takes for one? The Hoefer Auxiliary Head equips any driller so as to accomplish this big saving in time. It speeds up production in drilling tremendously. Not only do you save the drilling time, but also the time now lost in shifting the jigs and raising and lowering the spindle for the extra holes.

Hoefer Auxiliary Heads are made in any multiple, arranged in any manner, from 2 up. They are made by expert tool makers and unqualifiedly guaranteed to handle accurately the work for which they are designed.

Investigate now—every day you use a single drill where the multiple may be used you are paying for an auxiliary head through increased costs, but not securing its benefits.

Write for catalog. Send a blueprint of some of your work for estimate of time and cost.

BRISTOOL

Bristol 12-inch Rotary Precision Surface Grinder

Built for rapid production on grinding work.

It handles work either singly or in multiples within the capacity of the chuck and not thicker than 6-in., and grinds within quarter thousand in. of manufacturing accuracy.

And it is built to last.

It is provided with exceptionally long bearings throughout, especially in the back column. This prevents the wear, which is very slight, from affecting the accuracy of the grinder. The Back Column is made to swivel four degrees, which allows concave or convex grinding.

Bristol Rotary Surface Grinders are made in several types and sizes and are regularly equipped with 8-in., 12-in., and 16-in. magnetic chucks, either belt or motor driven and for dry or wet grinding.

Our Bulletin describes the many good points fully. Send us your name and address and we'll gladly mail you one.

Notes On Grinding
NORTON COMPANY. WORCESTER, MASS.

No. 72A

Grinding Wheels Versus Steel Wheels in Cleaning Cast Iron Gears

CLEANING sand and metal irregularities from between the teeth of cast iron gears is an operation of considerable importance for manufacturers of certain types of machinery. In the past and at the present time in some plants, a steel wheel running at high speed is used for this work. By this method the sand is removed nicely, but the irregularities in the gear itself cannot be removed. Instead they must be filed out, and this is a slow hand operation.

A test has recently been completed in which a 12 x ⅛ x 1", grain 46 Crystolon rubber wheel was used. The Crystolon wheel of course not only removed the sand, but also ground out the metal irregularities and produced an excellently finished gear, much more satisfactory than the filed gear.

The wheel was mounted on a Norton bench machine and the speed maintained at 3,000 r.p.m., or a little more than 9,000 surface feet per minute. Four-inch flanges were used. The operator using the steel wheel received a weekly wage of $20, whereas it was necessary with the rubber wheel to have a better and more careful man, who was paid $22. The filers worked on a piece work basis and received four cents per 100 teeth.

In using the grinding wheel, the filing was entirely eliminated and the operation was not as hard on the operator, inasmuch as he did not have to use as great pressure as with the steel wheel. Besides, the grinding wheel turned out over 40% more gears in a given period than could be taken care of with the steel wheel, not considering the time used for filing. The cost was reduced from 99 cents per 1,000 teeth to 48 cents, the chief saving being the expense of filing.

The cost per 1,000 teeth only included wages and cost of the grinding wheels. The steel wheel, file, and overhead expense were not considered. A very considerable additional saving would no doubt have been noted, had these been taken into consideration.

CANADIAN MACHINERY
AND
MANUFACTURING NEWS

Vol. XXI. No. 17 October 30, 1919

Do You Believe That the File is a Fine Tool?

Judging by the Various Steps in Its Manufacture We Would Say Yes. Herein is Described How **Ingersoll Files** Are Made, Right From the Rough Blank to the Finished Product

By J. H. MOORE, Associate Editor, Canadian Machinery

SUPPOSE we were to ask some type of machinists the question: "What is a file?" could you safely prophesy their answer? Ten chances to one they would hum and haw, and say that it was a—a thing to take off metal with.

This above statement may sound exaggerated, but it is unfortunately more truth than jest, for supposing we were to further question them regarding the care of a file, they would more than likely look at us in surprise, wonder at our ignorance, and remark: "Why a file don't need any special care."

Fortunately, however, this state of affairs is becoming less common, and the trend is pointing in the right direction, namely, that users of files are beginning to realize unthought of possibilities in this machine tool.

Is the File a Fine Tool?

We call the file a machine tool purposely, as it is as much a tool as any other cutting tool used on a planer, shaper, miller, etc. The machinist and tool maker at last is waking up to the fact that with proper care a file will last longer, and cut faster, than it would if handled in the ordinary careless style. Did you ever see the following incidents happen in your experience?

A tradesman has just completed the task of filing a piece to size, and feels that for the time at least he is through with his file. He opens the bench drawer, slams in the file amongst chisels, hammers and other miscellaneous tools. On next going to use the file he will soon remark to his next workman at the bench: "These files are absolutely no good. Last time I used this one it worked fine, but now look at it, the teeth are all shot, and it won't cut worth a hoot."

Has the writer overdrawn the picture? He thinks not, for this incident has also been observed in his experience.

He has noticed a workman use one file handle for three or four files. Every time he changed from one file to another, the following procedure would be gone through: Bang went the handle of the file, at the ferrule end, up against the vise, and out would come the handle. Next the other file would be placed tang in, on the handle. The vise was again resorted to, and bang went the file against the vise. Another very pretty and clever? trick is to bang the file against the vise sidewise, to knock the cuttings out of the teeth. Of course, all this helps to soon make the workman declare that these files are no good, etc., etc. He never seems to remember that there is such a thing as a file cleaning brush specially made for such purpose.

As we already commented, however, the outlook for a happier existence for the file is becoming apparent, and soon we hope to be able to report that the file wrecker is an oddity of the past.

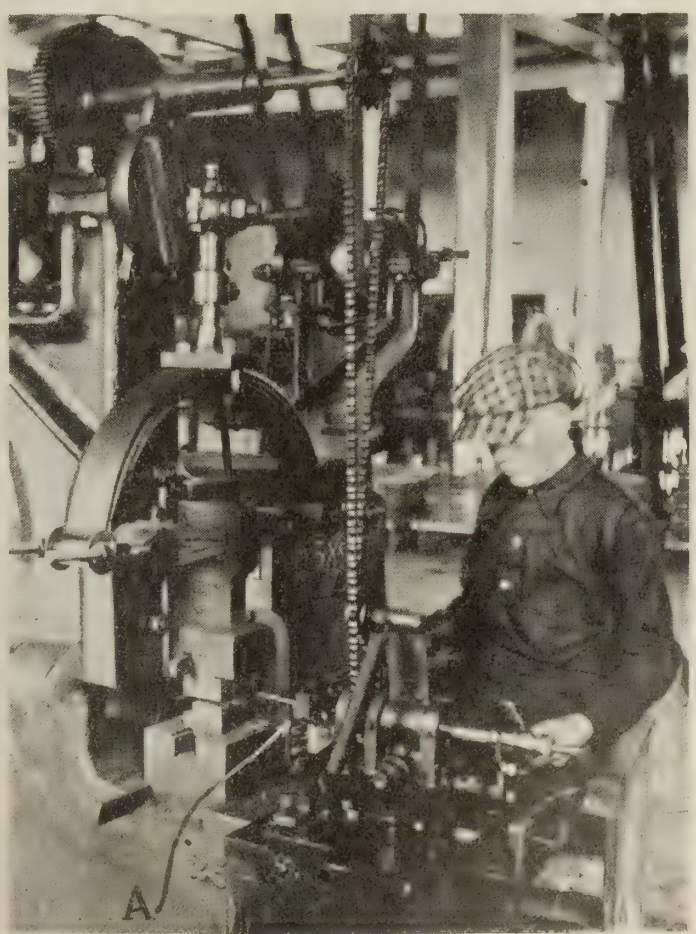

FIG. 1—AUTOMATIC TANGING HAMMER.

The Actual Manufacture

Leaving the care of the file for the present, and going into the actual manufacture of the file, may we ask the question: "How many readers know how a file is made?"

Not a great many, we will venture, so let us enter on a descriptive tour of the making of an Ingersoll File, from the rough stock, right up to the finished product ready for shipment.

To begin with, the material used is a high-grade crucible file steel specially made for the purpose. As readers are well aware, a file is either good or bad. There is no middle course. If the quality of steel is not there in the first place, no amount of workmanship will make it a good file. To stand up to the work, a file must first be made of the proper material. The firm whose product we are now about to describe, make it a special point to see that only

the highest grade of clay crucible steel is used. Open Hearth Steel is used extensively in the manufacture of files, but the **Ingersoll File Company** maintain that Clay Crucible Cast Steel is the only steel which can give real results in files. All tests have conclusively proven this, according to them.

The stock is stored in racks of the usual design. This storeroom is located directly in connection with the forging department, so that the least possible handling is done to the raw product before it actually starts on its various operations.

Forging Operations

The first operation on entering the forge shop is that of cutting off the

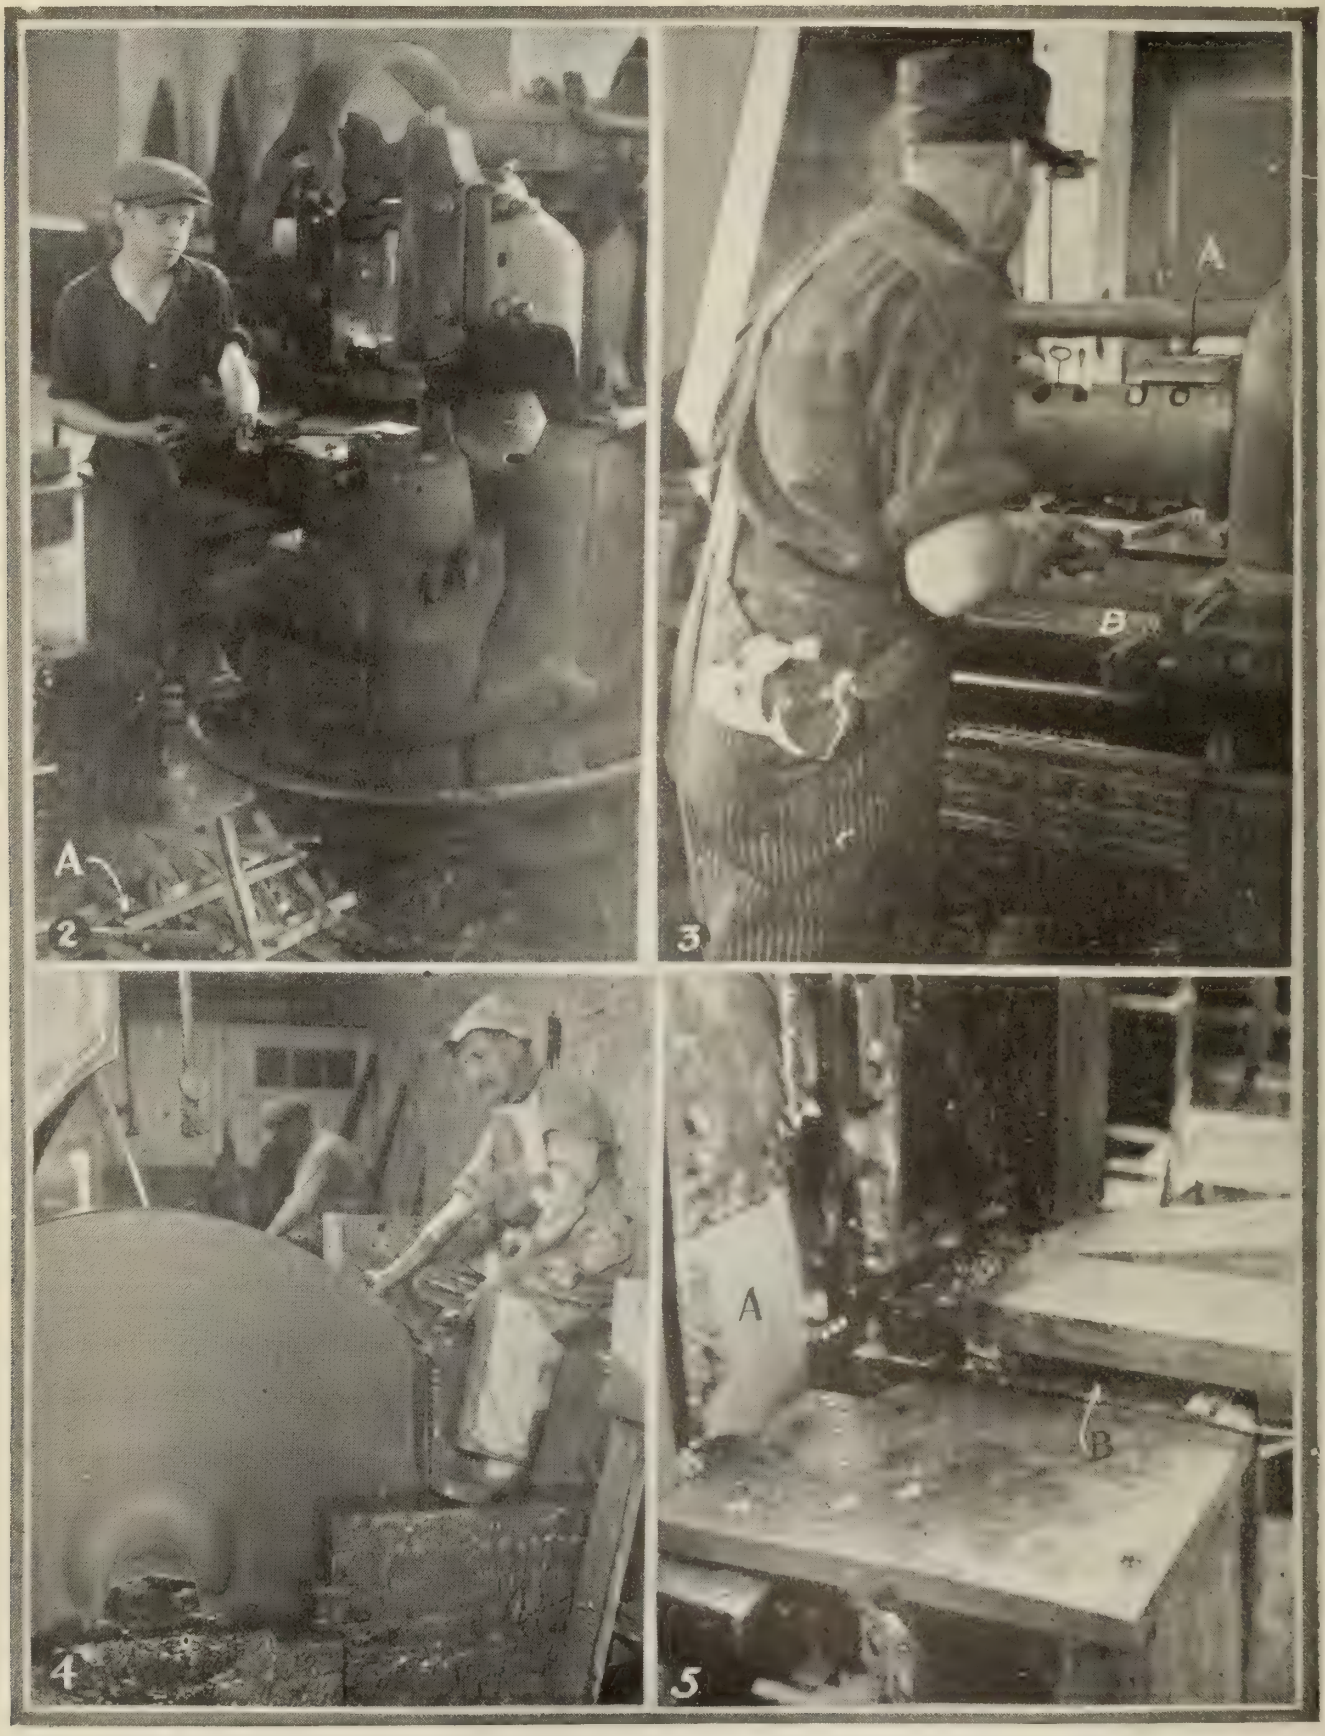

FIG. 2—POINTING FILE BLANKS ON BRADLEY HAMMER.
FIG. 4—THE OLD STYLE OF GRINDING.

FIG. 3—ROLLING SQUARE FILE BLANKS.
FIG. 5—NEW METHOD OF ACCOMPLISHING THE GRINDING.

stock in shears to the proper lengths to suit the various size files.

The next operation is that of forming, or blanking the file tangs. Of course, readers are all well aware what the tang of a file is, and by memory can picture the shape of this portion, on which the file handle goes.

On the smaller size files and up to the 8 in. size, these tangs are punched out on power presses, but on the larger size they are forged out on a Bradley helve hammer. Another method of producing these tangs is by rolling them out on a special rolling machine for the purpose.

These methods described are suitable for most shapes of files, but when triangular files are made, the procedure is somewhat different.

The file blanks are placed in a special chuck, A, as shown at Fig. 1, and the tangs are forged out by means of a special automatic hammer. The chuck already spoken of is driven by mechanism direct from the ram of hammer, by means of gears and chain, which can be plainly seen on the photograph. In this way the file blank revolves at the proper speed and produces an even and standard tang. The chuck is equipped with special ejector which shoots out the blank when finished without the operator touching it at all. This method of producing tangs has proved very efficient, and production figures are very encouraging.

The next operation is that of pointing the blank. By pointing, we refer to that portion of the file which is slightly tapered at its point. This work is accomplished in two ways, either by power hammer or rolls.

Fig. 2 illustrates the former spoken of method, the work being done on a Bradley hammer. Boys can readily do this work successfully. Some of the pointed blanks can be seen at A on this photograph. It will be noticed that these blanks are for flat files.

At Fig. 3 we show the workman pointing square file blanks on the rolls. The die A comes round at proper time and accomplishes the operation. There are also shaping and sizing dies which come in from the side at portion marked B, but we do not show these in the picture. The work is being done on Coulter and McKenzie Rolling machine.

While these various operations have been going on the blanks have become hard through forging, so that it is now necessary that they be annealed.

The Annealing Process

This concern has made a special study of the annealing process and have installed a battery of six annealing furnaces of special design. As the manager, Mr. Swallow, remarked to the writer: "We secured the services of an Old Country brick setter for this work, not just an ordinary bricklayer, and explained our wishes to him. The result is that we have furnaces in a class by themselves. The fuel (which is oil) goes through special burners built by the company, which have proved so efficient that no other type is used."

A remarkable figure of economy was given to the writer in fuel consumption, and he passes it along for readers to likewise read. Twenty burners are used throughout this plant at the low cost of less than $5 per day for fuel on all burners. The writer personally saw the bills, and other details, so can vouch for these figures.

To proceed with the annealing process, we will first mention that inside these furnaces the brickwork is so arranged that the flame is continuous in its action, a feature which will be easily understood. The blanks are all placed in annealing boxes and the flame never touches the blanks themselves. The work is heated up to temperatures around 1450 deg. Fah., according to the size of the file. Pyrometer is used, of course, to ascertain this heat.

The heat is now shut off and the work allowed to remain in ovens for at least two to three days, in order that they may be properly cooled.

After annealing they are straightened before going to the grinding operation.

Grinding Operations

It might be best to explain to readers not familiar with the peculiarities of steel, that, after annealing, there is a skin of considerable depth around the annealed blank which is decarbonized. This carbonless metal must be ground off entirely, as of course the decarbonized metal will not harden. This explains why the grinding operation is so important.

Roaks, and other surface defects, which, particularly in round files, might cause them to split on hardening, are also noticed after grinding, when the blanks can be rejected, but as a general rule the steel is of such uniform quality that very few blanks are turned back.

The grinding work is accomplished in two ways; the first of these being the old hand method. This style of grinding is illustrated at Fig. 4. Here we see the operator holding the round file blank to the grindstone by means of a special shaped hook. The blank is now ground until all the decarbonized material is taken off.

These huge stones range from 6 to 7 feet in diameter, and up to 11½ in. in width. This grinding operation is a costly one, as the stones do not last for any great length of time.

The second, and up-to-date method of grinding is shown at Fig. 5. Here the wheel is enclosed in suitable guard, all but the working portion A. The file blanks are held in a special plate B, which has rubber cushions attached to the same. This plate is placed in a sliding ram and traversed up and down the stone at a regular rate of speed. In addition to this, the wheel itself has a side motion, travelling sidewise while the ram carries the blanks up and down over the stone. This makes the wear on the stone even, and not only on one spot, which guarantees the blanks being ground perfectly true.

Other shaped files are ground by the same method, with holding plates of special shape to suit the file blanks.

Special Stripping Operation

The next operation to be performed is that of stripping the blank, or to use a more common expression, draw filing the blank. This work is accomplished on a machine specially built for the purpose.

Speaking of special machinery, it might be just as well to call readers' attention to the fact that this firm make whatever machinery they desire or require, as the file-making industry is something which is distinct in itself, and demands special equipment. They are well equipped to build up these various machines, as the next photograph will show.

At Fig. 6 we see a stripping machine practically completed and ready for work. To explain the action of this machine we would first call readers' attention to the crank A, which receives its motion from the tight and loose pulley seen to the left of this crank. The ram B in turn is driven backward and forward, from which the name draw filing comes. There are two holders for the file blanks C and D, which travel slowly back and forth with a sidewise motion, while underneath the ram B, at points directly above these holders, are placed finished files which accomplish the operation.

The operator rubs chalk on the blank being stripped from time to time in order to help the operation. After leaving these machines, the files are accurate in every detail, and ready for cutting.

The Cutting Operation

According to the size of the file they are cut on a small or large machine, and first for illustrative purposes we show Fig. 7. Here we see the girl operator about to feed the table A into the cutting chisel B. Depending on the size of file, width, etc., one or two files are cut at one time. In the case shown, two are being cut. We will make no special mention on this picture, but refer the reader to the next illustration, Fig. 8, which shows a larger machine from a different viewpoint.

We are looking from the working side in this case, and can see in detail the general construction of the machine. Two blanks are also being cut in this case, and can be easily seen in the photograph. A once more represents the travelling carriage. B the holder or cutting bed for the blanks. These beds are, of course, easily taken off or put on the travelling carriage, as the style of file blanks are changed. Each file machine has a set of these various sized beds.

The method of feeding carriage A is very simple. The handle D controls a nut, which in turn meshes with feed-screw E. On desiring the carriage to feed in, the operator places nut on screw; when on proceeding far enough he merely lifts the handle D, and brings the carriage back at once to its former and outside position. The rubber pressure block F is what gives the proper pressure and blow to the cutters. Of course the pressure is really controlled from the hand-wheel G, but the blow and rebound is taken up through the rubber block. It

takes considerable experience to make a first-class file cutter, as he must learn the art of knowing just when he has the proper pressure, angle, etc., on his cutter.

On looking at a properly cut file (that is by the ordinary eye method) it should appear an even dark shade. Should it be improperly cut, light patches will show up at various spots, showing that the file is not up to standard. Such files are scrap, and are not sent out.

In addition to this eye test, the files are tested under a microscope, when even cutting, proper shaped teeth, and so on are all checked up.

The round file is cut in one operation by means of a special fixture, which revolves at the proper speed, while the table feeds in. A special feature on these round files is the broken teeth as they are termed. These teeth are so arranged that proper clearance for file cuttings is made, and no clogging of the file results, but the cuttings drop away at once.

After cutting, the files are once more straightened before going into the hardening room.

The Hardening Process

On entering this room they are first washed in oakite, dipped in water, and lastly dipped in a special paste, and then dried.

The reason for applying this paste is as follows: These files are hardened in a lead bath, and if no protection was made for the teeth of the file, the lead would of course fill them up and render the file of little use. This paste fills the teeth up before they are sent to the hardening pot.

They are now heated as shown at Fig. 9, being first heated in a lead bath, then dipped and tempered in brine water. This brine water system is always kept cool and fresh by a continuous-action pump system, which ensures a fresh supply at all times. The writer had the pleasure of watching the temperer at work on half round files, and had occasion to realize that tempering is indeed an art in itself.

The workman, for illustrative purposes, demonstrated the correct and the wrong method, each file being heated to a similar temperature. First he explained the way it should not be done. Taking the file from the lead bath, he dipped it into the brine, when it came out some-

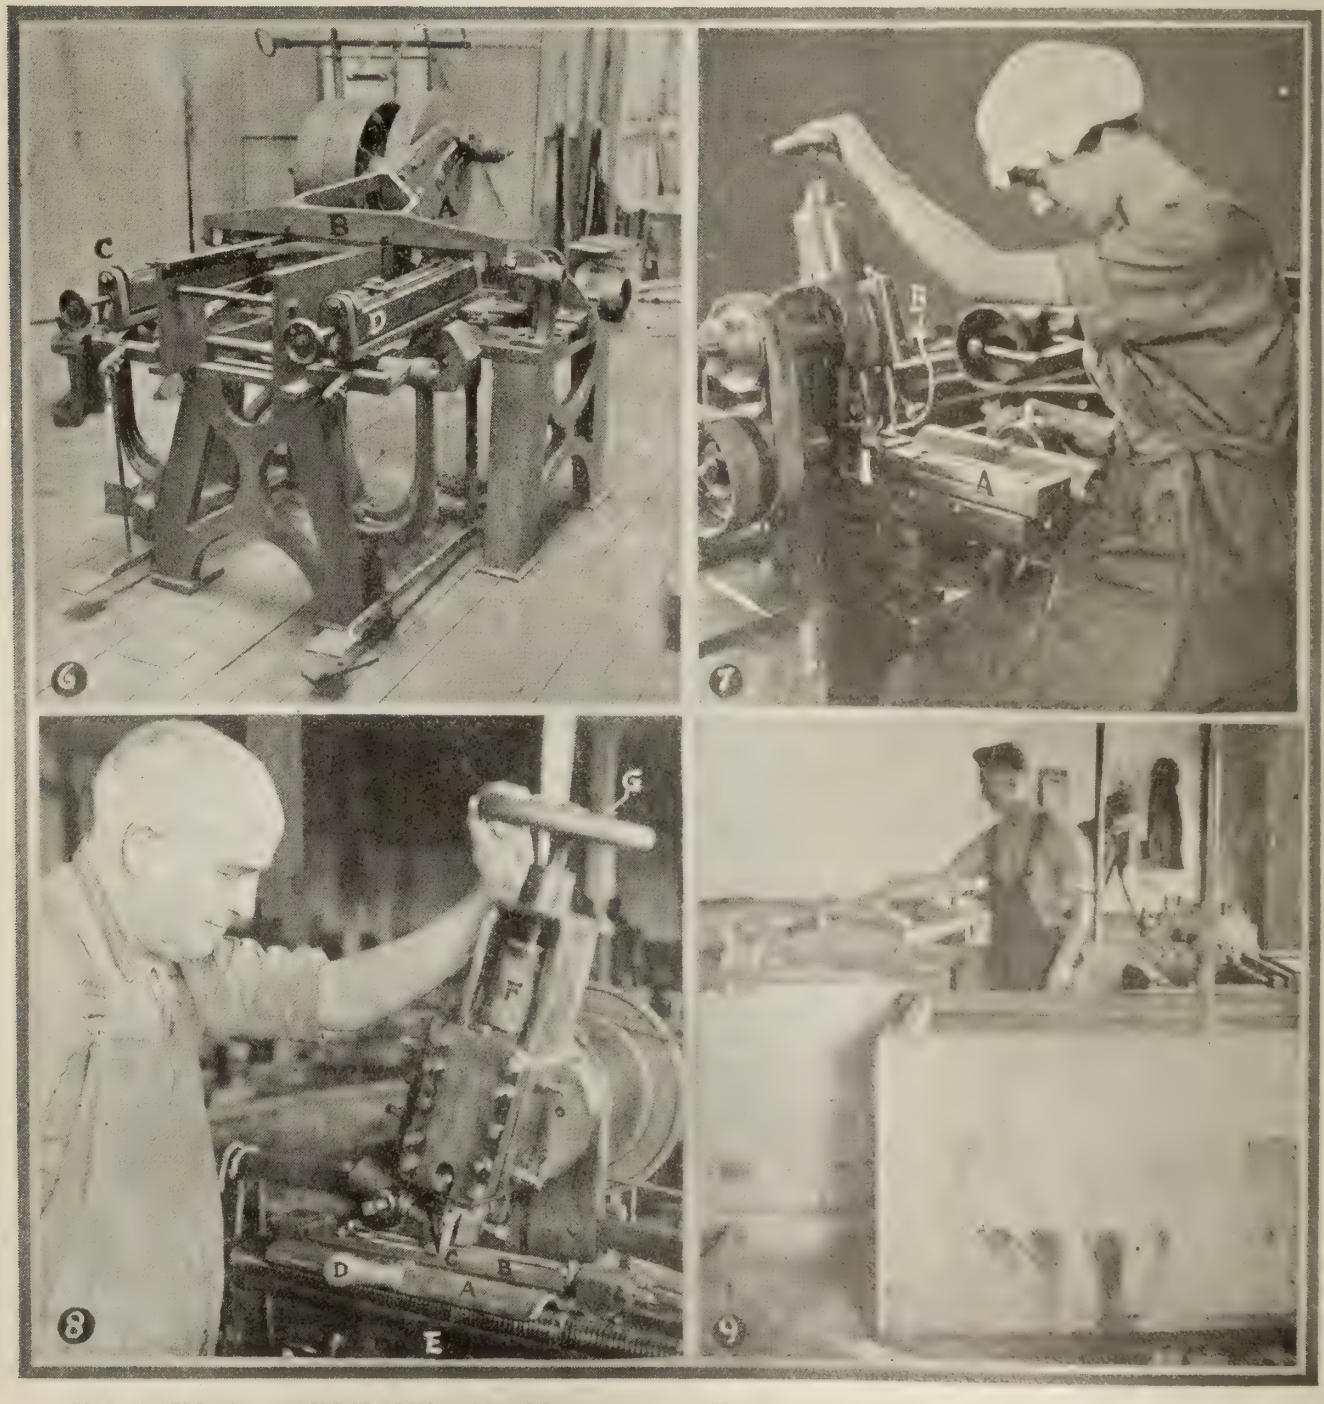

FIG. 6—A STRIPPING MACHINE ALMOST COMPLETED.
FIG. 7—CUTTING THE SMALLER SIZES OF FILES.
FIG. 8—CUTTING THE LARGE SIZE FILES.
FIG. 9—TEMPERING THE FILES.

what like the shape of a figure C. He next took another file of similar heat, dipped it into the brine apparently the same way, but the file came out straight as a die. More careful inspection proved that the worker gets so accustomed to the appearance of the blank as it leaves the lead bath that he knows just how to draw it through the brine to make it come out perfectly straight. In other words, tempering is not by any means learned in a day.

The files are now sand-blasted, as shown at Fig. 10. Readers will note the compact arrangement of this sand-blast chute. It is placed centrally on the hardening room floor, takes up little space and allows three workmen to work at the same time. Sandblasting being a process very well known, we will make no comment, except to say that this operation thoroughly cleans the files and removes all paste which may be still in the teeth.

Last, but not least, the files now go to the testing department, where a hardened prover is run over every file. These tools are named provers, because that is actually what they do—prove whether the file will stand up to the work. The provers are much harder than any steel which a file is likely to be used on.

The tester can easily tell if a file is not of sufficient hardness, for the prover will run over, and not grip on the teeth as it should. Every file must stand this test before passing inspection.

Now comes the actual packing and shipping. The files are wrapped carefully and packed in suitable sized boxes, then shipped in the regulation manner.

We have travelled the road from the blank to the finished product, so let us consider a few points of interest in this firm itself.

First and foremost, they believe in supplying the workers with a well lighted factory, and have done so to the limit, even to painting certain portions of the windows to prevent sun glare. All aisles are kept clear, and the plant in its entirety presents a very neat appearance. They employ from 80 to 90, and have a plant covering 90,000 square feet. Every year they turn out around a million and a half of files. Some imposing figure for 90 employees? They have in their employ certain men who have been in the file-making business from twenty years up. The writer made arrangements with the manager, Mr. Swallow, to interview one of the oldest of these men, with the result that we are able as a sort of conclusion, to mention this old-timer's views on the subject of files.

Files Then and Now

This gentleman, whose name is Gideon Nantel, has been with the file business for over forty years. He was good enough to relate his experiences, which we had best mention as he told them to us.

"I suppose you realize we had no machines in those days, but cut files by hand," he started. I nodded, and he went on.

"In those days we had no such things as oil furnaces, and used to do our forging with the aid of a sledge and open fire. When it came to grinding, we did this all by hand. All our draw filing, or stripping as it is called, was also hand work. To cut files in those days was some job. Have you ever seen a set of old-time file cutting tools?" he suddenly enquired, and on our replying in the negative, off he went and brought back the instruments of torture shown at Fig. 11. I call these instruments of torture advisedly, as you will soon learn.

"Well, now," Mr. Nantel continued, "cutting files in those days was a tiresome task. The small hammer A was used for the smaller sized files, and the small cutter B was what cut them. You held the chisel B on the blank, brought down the hammer with the proper force, then up and down until the file was completed, moving the chisel a little bit along each time.

"Of course it took considerable practice before you could work with any speed to speak of, and besides it often happened that you slipped and hit your hand instead of your chisel." (N.B.—Editor's note) We agree that this is quite possible, in fact more probable than otherwise for hitting a chisel with such a narrow head is to our idea some job.

"What was the young sledge C used for?" we asked. "That's not a heavy hammer," was the answer, "it only weighs 5 pounds; we had them as heavy as 10 pounds for certain sizes of files." "But what about your wrist?" we asked. "Oh, you didn't work it that way," was the reply. "You notice the peculiar shape and how the nose takes a sudden curve, well, you used it in this way. First you sat directly over your work, held the chisel D in proper position, and brought the hammer C down, more like a drop hammer than as an ordinary hammer. In other words, you used a straight up and down motion. Of course I will ad-

FIG. 10—THE SAND-BLASTING OPERATION.

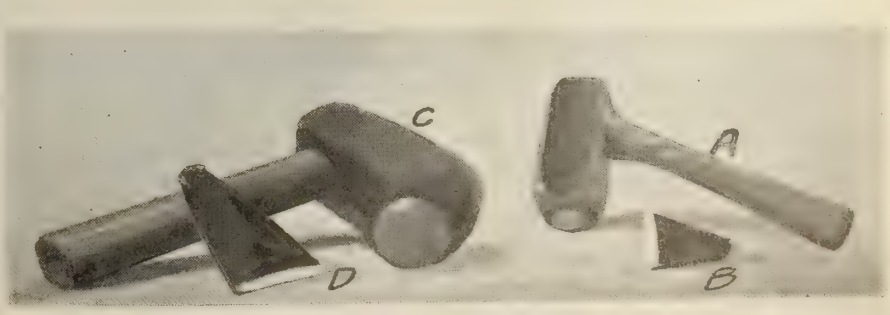

FIG. 11—HERE WE SEE THE OLD TIME HAMMERS AND CUTTING CHISELS.

mit your arms were a wee bit tired at the end of the day."

"What production did you obtain?" we asked. "Each man turned out two and a half dozen a day," he replied. "And by the modern method you turn out?" "30 to 40 dozen" was the answer. "Some difference," we replied, and he agreed with us. On the smaller sizes of files up to 120 dozen are cut every day by a skilled operator. So here is still greater production difference.

"There were thirteen to the dozen in those days," commented Mr. Nantel; "the extra one paid the manufacturer for the scrap. I guess that was the idea; it's the only one I know of. Our annealing was done in wood fires, and our hardening in charcoal. Twelve hours was employed in annealing, and thirty-six hours in cooling. The hammers I have shown you are over forty years old," finished the old-timer in this very interesting industry.

An article of this nature would hardly be complete without a final word on the care of the file. We have tried to show that a file is as much a fine tool as any other cutting tool, and therefore should be taken care of. In conjunction with this article we show in panel form a set of suggestions which this firm has issued and sends out with its product. These suggestions are well worth keeping and paying attention to, so, with the suggestion that readers study this panel carefully, we close by stating once more: "Remember the File is a Fine Tool."

A FILE IS A FINE TOOL

The point of each tooth on it is as beautifully sharp as the edge of a good chisel. If carelessly handled, some of these teeth are broken, with the result that the next time the file is used it seems dull and makes furrows or ridges in the work.

DON'T throw files carelessly into the drawer with cold chisels, hammers, etc.

DON'T leave files lying around on the bench or lathe where they are liable to be swept on to the floor and broken. Hardened steel is necessarily brittle, and we take a pride in making our product as highly tempered as we know how.

DON'T keep files in a damp place. Rust will ruin the best tooth ever cut on a file.

DON'T use a file for any other job than that for which it was made. Because it is "Only a File" is no reason why it should be made the "Handy Man" of the shop.

May we suggest that you provide a rack for your files as you do for your drills, etc., so that they may be properly stored when not in use?

If these suggestions are acted on, we think you will find the life of your files materially lengthened, and that they will keep their cutting edge; in which case you will be better satisfied as users and we as producers.

ALWAYS REMEMBER, A FILE IS A FINE TOOL.

INGERSOLL FILE COMPANY, LIMITED, INGERSOLL, ONTARIO

Speeding Up Machine Tools With Compressed Air

Production Depends Largely on What Facilities You Have for Handling Your Product. Herein is Discussed How the Work Can be Accelerated by Means of Compressed Air

By F. A. McLEAN

QUANTITY production on an efficient basis is largely dependent on the facilities provided for handling the product during the course of manufacture and in order that maximum production be maintained it is necessary to make the physical requirements called for on the part of the operator as light as possible. When this is done a workman should be able to accomplish practically the same amount of work towards the close of the day as in the beginning. If this is not done, no matter how strong the man may be, he is bound to feel the strain from his continual exertion, and his efficiency and value to his employer is lowered as the day advances.

Any arrangement which will minimize this fatigue on the part of the worker is worthy of attention from the standpoint of higher efficiency, as the conservation of physical energy so often spent in non-productive labor is of primary importance. Aside from the process of moving the work to and from the machine, the operation of the latter generally calls for considerable exertion on the part of the worker, especially in the case of heavy machine tools. This is in time bound to affect his ability to maintain a uniform output throughout the day.

One of the most flagrant offenders in this respect is the ordinary lathe, especially in the larger sizes, which require the expenditure of considerable energy in backing off the carriage after a cut has been made. In the case of quantity production, this often consumes a larger amount of time and labor which could be more profitably applied in other ways. Many of the more progressive manufacturers who realized this fact have applied a direct lift air hoist cylinder to the task with a view to relieving the operator and speeding up the output from the tool. During the war devices of this nature were quite a common sight in the large munitions plants of the United States and Canada, but with the close of the shell contracts, many of these contrivances have gone to the scrap heap, which is unfortunate, as many shops could apply them to the manufacture of their regular products with excellent results.

An arrangement of this kind applied to a 24 in. x 20 ft. lathe used for drilling holes in submarine drill pistons in the plant of the Canadian Ingersoll-Rand Company, Limited, Sherbrooke, Quebec,

VIEW FROM TAILSTOCK END OF LATHE SHOWING METHOD OF SUPPORTING AIR HOIST CYLINDER AND THREE WAY VALVE.

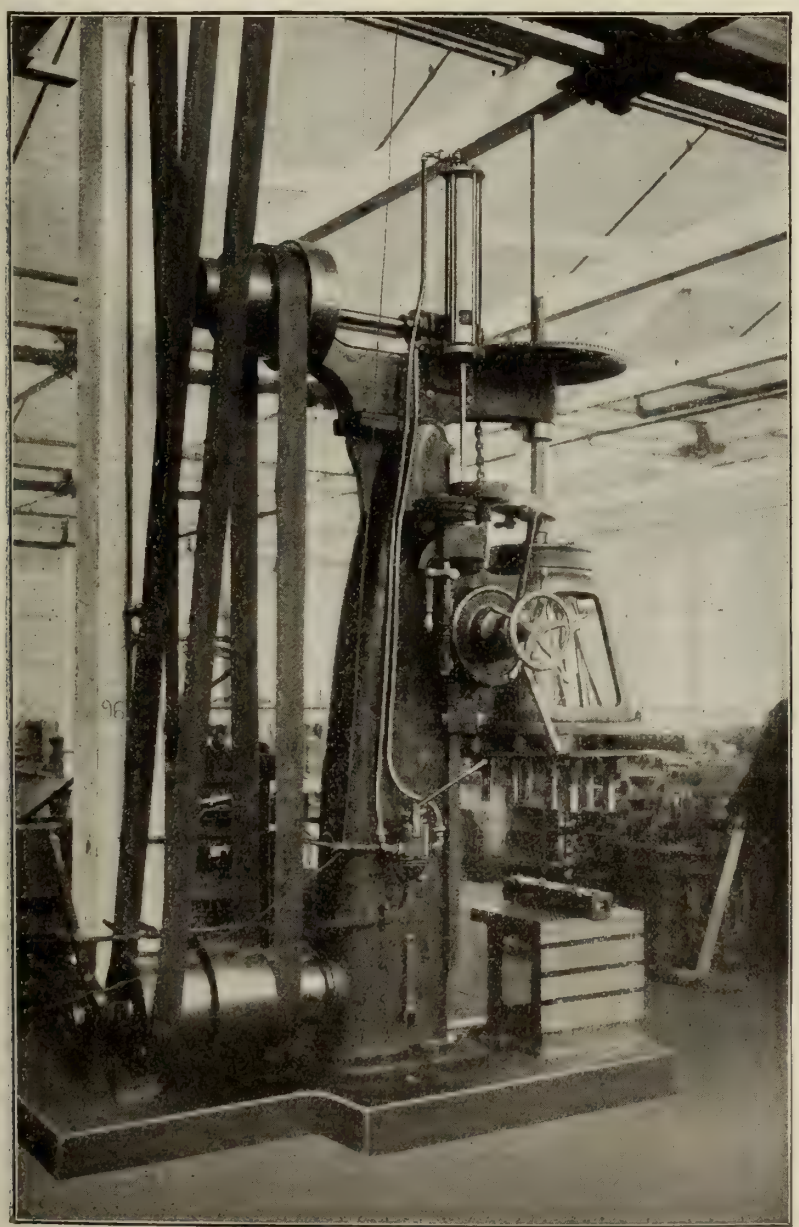
is shown in figures one and two. From an examination of these illustrations it will be seen that the air hoist cylinder, which is 3 in. in diameter by 4 feet long, is placed between the shears of the lathe and supported at each end by rectangular pieces of iron, which are re-clamped to the lathe bed by tightening four bolts. A hole is bored in the lower [illegible] of the lathe carriage into which is fitted the end of the hoist piston rod, from which the hook has been removed. Lock nuts prevent the rod from shifting.

This arrangement allows the cylinder to be moved to the most convenient point on the bed, or even removed altogether and applied to another machine in a few minutes, if desired.

The hoist cylinder is of the double acting type and is controlled by a very simple three-way valve located within convenient reach of the operator. Pushing the handle of this valve to the left causes the carriage to travel towards the headstock and vice versa, while moving it to a central position cuts off the air supply and allows the air in the cylinder to exhaust. A globe valve is placed between this three way valve and the supply hose to take the strain off the three-way valve when the device is not in use. It is perhaps of interest to note that the pistons drilled on this lathe are used in the largest water tube rock drills ever made in Canada.

These submarine drill pistons are about five feet long, and to drill a small hole through them from end to end with a twist drill is quite a nice job. It was accomplished with little or no trouble by the lathe illustrated. The drill was held in a fixture bolted to the carriage and a stream of cutting compound under pressure was used to keep the drill cool and wash out the chips.

Some of the more modern multiple spindle drill presses are provided with means for raising as well as lowering the head by power, but in many shops there are machines in use which do not have this feature, and when these are of large size it is very tiresome for the operator to have to raise the heads by hand. A simple way of using compressed air to do this work, which has proved very satisfactory, is illustrated in figure 3, and consists of a small double-acting direct lift hoist attached to the top of the drill press by a cast iron bracket. The lower end of the piston rod is screwed into a hole bored in the top of the saddle or head of the machine. Supply pipes run from the upper and lower end of the hoist cylinder are bent to conform to the contour of the machine and terminate in an adjustable valve or speed box located near the belt and feed controls of the drill. With a drill press fitted up in this way it is possible for an apprentice boy to turn out a larger production than a fully grown man could when moving the drill head by hand.



RAISING AND LOWERING HEAD OF 8-SPINDLE DRILL BY AIR.

A minister living in "a country district" of the Hawaiian Islands had great difficulty in making his parishioners feel they were properly married until he devised the following service:

To the man: "You savvy this woman?"

"Yes."

"You likee?"

"Yes."

"By and by you no kick out?"

"No."

To the woman: "You savvy this man?"

"Yes."

"You likee?"

"Yes."

"By and by you no kick out?"

"No."

"Pau (done). Let us pray."—San Francisco Chronicle.

Sad, But True

There was a man who fancied
That by driving good and fast
He'd get his car across the track
Before the train came past.
He'd miss the engine by an inch,
And make the train hands sore;
There was a man who fancied this—
There isn't any more.

There was a wise old trainman,
Expert at coupling cars,
He used his feet to push in place
The knuckles and drawbars.
He did it thus for many years,
And thought it was great fun;
He had two feet to push them with,
He now has only one.

Bill Jones on the repair track,
Imagined he could do
A moment's work beneath a car
Without the flag so blue.
Well, yes—he did it many times,
In spite of rule and warning;
One day an engine bumped the car
Bill's wife is now in mourning.

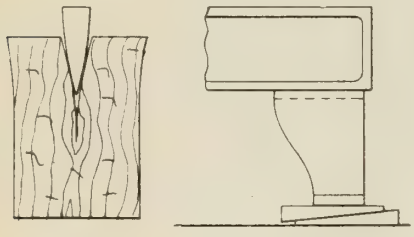
Between the rails of the northward track
Mike smoked his pipe of clay,
As "55" with time freight south
Sped noisily on her way.
'Twould take four steps to clear both tracks,
These steps Mike did not take,
Then Number 2 approached unheard,
Result—"An Irish Wake."

Shop Arithmetic, Inclined Plane, Wedge, Screw

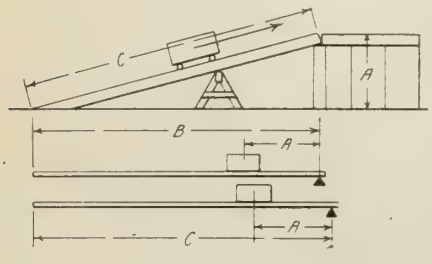
Thirteenth of a Series in Practical Mathematics for the Mechanic and Those Learning the Machinist Trade—The Present Article Takes Up Some Problems in the Three Above Subjects Mentioned

By J. H. RODGERS

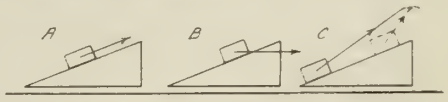
CLOSELY associated to problems involving the practical application of the simple and compound lever, is the inclined plane (wedge) and screw, examples of which are to be seen in everyday shop practice. As the name implies, the inclined plane is a surface that is inclined at an angle to the horizontal, and while this definition specially refers to inclined surfaces in general, the theory and the calculations, in some respects, are identical to the wedge and the screw principle. The most simple form of the wedge may be seen in the splitting of wood, in the alignment of machine tools, or other heavy objects.



The theory of the work performed by means of the wedge is quite similar to that of the block and tackle, and is merely the energy that is required to raise the weight in the vertical direction, plus that necessary to overcome friction. Suppose a large case is to be skidded up an incline of 30 degrees on to a truck or platform, the work performed would be the same as if the weight were raised vertically, although the object had been moved through a greater distance. The action may be compared in some respects to that of a lever where the force applied is less than the weight raised, but moving through a greater distance. This will be more clear by referring to the following sketch:

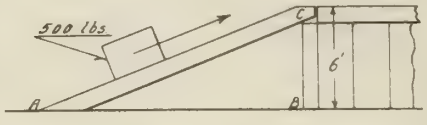


From this it will be seen that the mechanical advantage is increased by decreasing the angle of the inclined plane. In moving a weight up an incline there are three distinct methods that may be followed, namely; where the force applied acts parallel to the inclined plane; where the force acts parallel to the horizontal plane, and where the force is applied at a constantly changing angle, as shown in the sketches A, B, and C.



As the third case involves the use of advanced arithmetic, it will be dealt with later on, so that we can confine our present calculations to the first two cases. A little thought will show that the first method will be the most efficient as the mechanical advantage is greater. The force applied acts through a distance equal to the length of the inclined plane, and from the rules previously given for such work the power multiplied by the distance through which it moves, will equal the weight multiplied by the vertical distance through which it is raised.

For the above case, suppose a weight of 500 pounds is raised to a platform 6 feet above the floor, using a skid at an angle of 25 degrees, what force would be required, figuring the power necessary to overcome friction at 25 pounds?



With an angle of 25 degrees and a raise of 6 feet, the length of the incline would equal the hypotenuse of the right triangle A B C. In order to find this length we must use the principle of trigonometry, as outlined in the ninth lesson. The rule would be:

$$Hypot = \frac{Side\ Opp.}{Sine} = \frac{6}{.42262} = 14'\ 2"$$

To find the power required, use the rule as stated above, which as a formula would be:

$$P \times (A-C) \qquad W \times (B-C) \quad or$$

$$P = \frac{W \times (B-C)}{A-C} = \frac{500 \times 6}{14.2} = 211 + lbs$$

With 25 pounds necessary to overcome friction, the total force required would equal 211 + 25 = 236 pounds.

If, on the other hand, the power had been applied in a direction parallel to the ground, or horizontally, the force would have acted through a distance equal to the base of the triangle. This distance and the resultant force required to advance the weight up the incline, would be as follows:

$$Side\ Adj. = Cotan \times Side\ Opp. \quad or$$

$$Base\ (A-B) = 2.14451 \times (B-C) =$$

$$2.14451 \times 6 = 12.86706\ feet$$

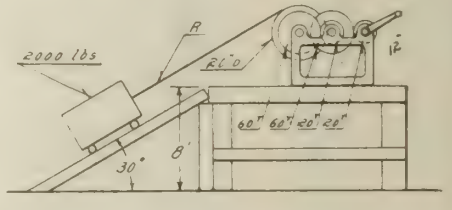
$$Then\ P \times 12.87 = W \times 6 \quad or$$

$$P = \frac{500 \times 6}{12.87} = 233.1\ lbs$$

$$and\ 233.1 + 25 = 258\ lbs$$

as the total power necessary.

In the two examples given above, the force required was practically one-half of the weight being raised, so that for heavy weights some mechanical combination would be adopted to increase the mechanical advantage. This could be done as shown in the last lesson, or a small windlass could be utilized for the purpose. In the sketch below, what power would be required to move the weight of 2,000 pounds up the incline, friction being neglected?



The length of the inclined plane would be:

$$Hypot = \frac{Side\ Opp.}{Sine} = \frac{8}{.5} = 16\ feet$$

The tension in the rope R would then be:

$$P = \frac{2000 \times 8}{16} = 1000\ lbs$$

The advantage in the windlass is in the compound arrangement of the gearing, and to find the power required on the hand lever, we proceed on the basis that the power applied, multiplied by the length of the power arms, equals the weight times the weight arms, so the solutions of the above would be as follows:

$$P \times 12 \times 60 \times 60 = W \times 10 \times 20 \times 20 \quad or$$

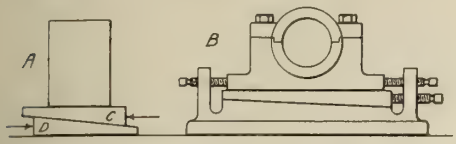
$$P = \frac{W \times 10 \times 20 \times 20}{12 \times 60 \times 60} =$$

$$\frac{\overset{500}{2000} \times 10 \times \cancel{20} \times \cancel{20}}{\cancel{12} \times \cancel{60} \times \cancel{60}} = \frac{5000}{27} = 185\ lbs$$

$$3 \quad 3 \quad 3$$

An application of the wedge that will be recognized as frequent shop practice, is shown below at A. The force applied may take one of several forms. Ham-

mers or sledges may be used, or common jacks used to provide the necessary power to raise the weight. The same principle is adopted in the pillow block shown at B, and here it is used more for adjustment to position than for weight raising.



Suppose in the case A, the wedges had a taper of one inch per foot, and the weight of 1,500 pounds had to be raised half an inch, what power would be required to be exerted on the wedge C, and what distance would it have to move, the wedge D remaining stationary? With a taper of one inch to the foot, the wedge C would have to move forward 12 divided by .5, equals 6 inches. If the force is applied in a horizontal direction the power would be:

$$P = \frac{W \times .5}{6} = \frac{1500 \times .5}{6} = 125 \text{ lbs.}$$

In the case of the pillow block shown at B, the centre line of the bearing has to be raised 1-32 of an inch and moved ⅛ of an inch to the left; how many turns would be required on the adjusting bolts it the pitch was 1-10th of an inch for the lower adjusting, and 1-12th of an inch for the upper locking screws, the taper of the wedge being ¼ of an inch per foot?

With a taper of ¼ inch per foot the movement of the wedge for a 1-32 inch lift would be:

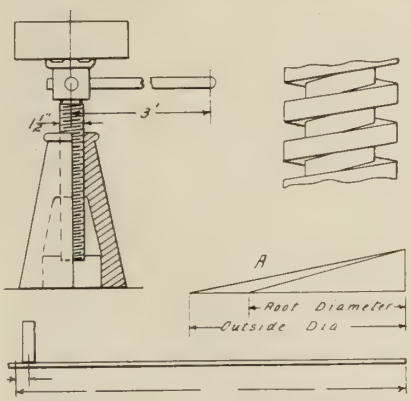
$$\frac{1}{4} : \frac{1}{32} = 12 : x \quad \text{or}$$

$$x = \frac{12}{1} \times \frac{1}{32} \times \frac{4}{1} = \frac{3}{2} = 1\frac{1}{2} \text{ inches.}$$

With a pitch of 1-10 inch the adjusting screw would be given 1.5 x 10, equals 15 turns. The lateral or side movement of ⅛ inch would require:

$$\frac{1}{8} \div \frac{1}{12} \quad \text{or} \quad \frac{1}{8} \times \frac{12}{1} = 1\frac{1}{2} \text{ turns.}$$

What might be classed as a continuous wedge or inclined plane is illustrated in the sketch of the screw-jack herewith:



Suppose the screw has 6 threads per inch and the lever is 3 feet long, what pressure would have to be used to raise a weight of 2 tons, friction being neglected? The angle of the inclined plane formed by the screw would be found by calculating the circumference and by "trig."; the development of one turn is shown at A, and at B is seen an enlarged section of the thread. By referring to the sketch A it will be seen that the angle of advance in a screw thread is not uniform owing to the difference in the diameter between the outside and the root. When calculations are made in connection with screws, the angle adopted will depend on the prevailing conditions, but in general, the use of a mean would serve most purposes.

The screw-jack problem, simplified, is shown in the lever diagram at C, and the solution would be:

$$P \times 36 = W \times \frac{1}{6} \quad \text{or}$$

$$P = \frac{4000 \times \frac{1}{6}}{36} = \frac{4000 \times 1}{36 \times 6} = 18.5 \text{ lbs.}$$

One day, many years ago, the telephone in the office of the chief of police rang. Chief Speers answered. The call was from a new policeman on the Union Avenue beat. He said:

"A mon has been robbed down here, and I've got one of thim!"

"Which one have you?" asked the chief.

The reply came back: "The mon that was robbed!"

Does the Crane Receive Consideration it Deserves

A Paper Delivered Before the Metals Section of the Eighth Annual Safety Congress of the National Safety Council at Cleveland, Ohio, Under the Heading of "Consider the Crane"

By CHESTER C. RAUSCH, Assistant Director, Safety Institute of America, New York City

EVER since Noah handled lumber while constructing the Ark, and the Egyptians stones while building the Pyramids, the problem of handling material has been present in industrial work of whatever sort or kind. It is not improbable that one of the earliest methods of handling material was by the use of some form of rope manufactured of hide or woven barks passed over the limb of a tree. Later some means was found to use parts of trees that had been blown over, or that had in some way been felled, to construct the simpler forms of derricks. As we know them to-day, derricks and cranes are the result of a development extending through centuries and representing the solution of many problems one after another. Of late years various forms of power have placed at the disposal of man a ready means for adapting his machines to types of work that were formerly done by the laborious efforts of man and beast.

In no particular field has greater development been made than in that of handling and conveying materials in connection with the processes of construction, manufacture, and transportation. More recently the fact that electric current furnishes such a flexible source of power has greatly accelerated this development and in the past decade the enormous increase in the use of steel and iron for the fabrication of structures and objects formerly made of wood has called for a further development of machinery to handle the greater unit weights involved. During the last three or four years particularly the production of cranes of all sorts has increased unbelievably and not only is their lifting capacity greater but their flexibility of operation and their safety of manipulation as well. Where we formerly saw a braced pole derrick superseding a single stick or gin-pole, we now find locomotive cranes, tower derricks, overhead travelling cranes, gantry cranes, floating derricks, wall cranes, gib cranes, and a variety of combinations of these devices that enable almost any conditions where material must be handled to be met by the selection of a type of crane to do the work and that will, at the same time, consume the least power, offer the greatest flexibility, and afford the greatest safety during operation.

During the last ten years the writer has had opportunity to observe the operation of cranes of all types used in manufacturing processes and in construction work, as well as in those fields that generally are considered under the head of transportation. In spite of the developments that have been made, both from the point of efficiency and safety, there appear to be still a large number of hazards that are reproduced repeatedly in the construction of later models or that result from the manner of their installation or the method of using them. It is to call attention to some of these points and to offer some suggestions by which these recurring hazards may be eliminated that the present paper is prepared.

The locomotive crane is coming to be one of the most common types in use, both in shops and in yards. Unlike the overhead travelling crane, it is not confined to definite limits of operation within a building or over a given yard space but, because of its mobility, it operates equally well within a shop or about a yard. This flexibility of operation considerably eliminates the number of times that a piece of equipment must be handled when it is taken from one location to another. Moreover, the boom forming part of its construction enables it to reach places an overhead crane could not approach. This one feature, probably more than any other, has brought about its introduction in many plants to perform a great variety of work formerly done with the use of rollers, skids, and various sorts of lifting tackle. The locomotive crane is a rather recent development, and while its hazards are more or less obvious, there are not as many men available who are skilful in handling this type of crane as there are of other types. The greater skill required in their operation, and their mobility, has resulted in a greater number of accidents from their use.

One of the main sources of hazard consists in the failure to keep the road-bed over which the crane must travel in the best condition. Frequently, in an effort at economy, light weight or partly decayed sleepers and second-hand, defective, or light rails have been used, resulting in an inconvenient and unsafe road-bed. The failure to keep the road-bed properly tamped and drained allows it to settle and become uneven, so that the crane does not travel steadily and is far more liable to overturn. The use of improper frogs, cross-overs and switches, and the failure to keep them in repair, increase this hazard. Such a road-bed throws numerous strains into the structure of a moving crane by the swinging motion imparted to the load suspended from the boom. This condition sometimes becomes aggravated to a point where collision of the suspended objects may occur with other railroad property or with structures in the yards adjacent to the track upon which the crane travels. This distracts the engineer's attention so that collisions with pedestrians, trucks and teams are more apt to occur.

When locomotive crane track-ways are placed too near buildings, especially on curves, the entire attention of the engineer is often required to prevent collision with buildings, and in cranes that are capable of considerable speed of movement damage is frequent. Where the crane is large, both in lifting capacity and range of boom and the engineer's cab is located some distance above the ground, this hazard is peculiarly acute. The writer recalls a case where a slow-travelling fifty-ton locomotive crane could pass a building only by being turned on its table at the same time it was moving ahead on a portion of a curve. The corner of a building placed beside the curve was entirely demolished and a considerable portion of the roof removed by being struck by the frame. Another time, while making this turn, the engineer was giving his entire attention to avoid collision with the building and failed to notice an automobile truck standing close to the rails. On a straight track it would have cleared the truck, but caused a collision because the crane was turning on its table. The crane, which had considerable power of locomotion, forced the truck against the side of the building, demolishing its entire front end.

Overturnings are frequent with locomotive cranes. In the smaller sizes the wheel base is extremely short, and in many cases the boom is swung with loads beyond the safe capacity for any increased angle of elevation and the crane is tipped on its side when this angle is increased ever so little as a result of even slight inequalities in the roadbed. Even when travelling on a straight track under these conditions and with the boom axis parallel to the axis of the track, slight obstructions on the rail are sufficient to cause disaster because the crane is working practically at its ultimate lifting capacity, and its point of safe balance. This type of accident occurs in construction work particularly, because the road-bed is nearly always of a temporary nature and poorly laid. Moreover, on such jobs, supervision of crane operators is apt to be less careful and the material handled less standardized in size and weight, so that overloading is easier and more frequent.

Another difficulty is the inability of the operator to maintain a clear view both ahead and behind his crane while travelling. Inability to see toward the rear when the crane is moving forward frequently results in people being injured when his crane is turned on its table and inability to see toward the rear may cause people or objects to be run over when the crane moves in that direction. Reflecting mirrors, similar to those used on automobiles, tend to eliminate this difficulty, provided the mirrors are adjusted carefully and are of sufficent size to afford ample view. In some cranes small windows have been placed low down in the rear of the crane and the storage tanks and coal pockets altered to permit the use of peekholes through which the engineer while standing in his usual place and turning his head can see behind the crane. Even when alarm bells or gongs are used the engineer cannot be certain, without seeing, that an accident is not imminent to material or persons on the track.

Whenever any crane overturns, unusual and frequently very considerable strains are placed on the structure of the crane, particularly the boiler and steam piping which, because of the internal pressure in them are already seriously stressed. Engineers, even if they are fortunate enough to scape scalding or injury when the crane overturns, may be penned in and seriously burned unless the doors and windows on such cranes are arranged to open outward and are provided with fasteners operating from both the inside and the outside.

Many times the original structure of the crane, particularly the boom, has been changed; lengthened to increase its range, strengthened to increase its capacity for lifting. Any lengthening of the boom immediately reduces the capacity of the crane to handle safely loads at a given elevation, and an increase of the cable size and strength or an increase of the steam pressure to permit the lifting of heavier loads at greater boom elevations introduces strains that frequently cause collapse. The failure of many crane engineers to recognize the tremendous reduction in the safe capacity of the crane due to any change in elevation has resulted in the collapse of many booms. This tendency to lengthen the boom has been greatly increased by a desire to facilitate the placing of work in locations beyond the reach of the boom as originally made. The writer recalls a number of instances where such changes as this have resulted in death to the operator. It is a tendency that most certainly should be corrected.

If the operator of a crane, and particularly of one that has been structurally changed, is given to the performance of spectacular stunts while operating it, the limit of damage is beyond estimate. Speeding the crane along the track, rotating the crane upon its turn-table at such speeds that the load is swung far beyond a point directly below the end of the boom, thus virtually increasing its length in addition to creating a considerable side strain and the dropping of loads from considerable heights and stopping it just before it reaches the ground, are performances which the cranes were not constructed to stand, even considering all factors of safety used in its design. The combination of two or more of these performances at the same time may introduce strains great enough to overturn the crane, to destroy its structure, and to injure not only the crane but many structures adjacent to it. Where the crane is elevated upon a trestle the hazard is greatly increased because strains are sometimes thrown upon such a structure that it cannot safely withstand them. If the crane falls from such a structure it is obvious that the damage is apt to be tremendous. Many operators overload cranes and take a chance that the crane can handle the load. This tendency is fostered by the fact that the crane is never under the observation of a single foreman but moves from place to place in charge of its operator. While such acts are, of course, matters of discipline, there are several devices which have been attached to cranes to indicate when the crane is at the point of overturning and to give audible warning beforehand. The best devices of this sort are placed in the cab of the engineer and are frequently supplemented by an indicator placed on the boom which shows, by means of a pointer, the safe load that may be picked up for any given boom elevation. This indicator may also indicate safe overhead clearances for the boom. The use of the tables of safe boom elevations for given loads frequently placed on plates attached to the frame of the crane or in the cab, cannot be depended upon because they require the exercise of the element of personal es-

timation of conditions upon the part of the operator.

Whenever cranes approach obscure corners of buildings, door openings, or other point from which traffic or individuals may issue, the engineer should be under obligation either to stop the crane or to have it in such control that a collision could occur only under unusual circumstances and then in a manner to cause only minor injuries.

Locomotive cranes are frequently poorly illuminated even when they perform their work in places where the operator has no adequate opportunity to see clearly the work he is doing. The placing of several storage battery cells aboard such a crane provides current for adequate light in the interior of the cab for firing and for illuminating the gauges and particularly for a spot light that can be controlled by the engineer and thrown upon the objects he is handling. Very frequently a light placed on the tip of the boom, and arranged to throw its rays vertically downward, has been found of great advantage. Whenever such cranes work at night, consideration should certainly be given to these points.

The work done by locomotive cranes is nearly always conducted out of doors and little attempt is made to house them or to protect them from the elements. As a result, rust, with all its attendant and subtle hazards, attacks the machine in various places—the cables particularly. Proper painting should be given at frequent intervals, adequate lubrication provided, and the boiler should have regular inspection. Improper feed water may introduce trouble enough to put the crane out of commission.

In the operation of such cranes dependence is frequently placed upon lowering the load and swinging the boom to throw an object upon storage piles or into a location that cannot be reached by the crane when in its ultimate safe position for such a load. The element of time is here depended upon to permit the load to swing into its final place before it can tip the crane far enough to cause it to overturn or leave the rails. Any failure of judgment on the part of the operator is fatal.

Another pernicious tendency is sometimes revealed when the crane is derailed and a leverage action is created by attaching the boom to the track ahead and by the application of power causing it to lift the rear end of the crane so that it may be swung again to the rails. This is done with the boom in an almost horizontal position and has destroyed cranes by introducing the severest strains to which the crane could be subjected. It is obvious that this can only be done where the road-bed is laid in a manner sufficient to permit such a strain. Recognizing this fact and to increase the leverage the operator endeavors to reduce this strain on the track to a minimum by placing the boom in its lowest position. The housing of the hoisting mechanism and the anchorages of the turn-table are very often torn apart in this manner.

Overhead travelling cranes have probably received as much attention at the hands of designing and safety engineers and inspectors as any other single piece of equipment. This is probably due to the fact that it travels over areas in which are located many workmen and much valuable machinery and material, so that a failure of any part of the crane may bring about disastrous results. A locomotive crane necessarily clears its own way before proceeding so that there is not the same proportion of hazard as in the overhead crane, which may create dangerous conditions over the heads of many men without their knowledge. One common fault is the failure to keep the rails upon which the overhead crane travels in proper line both for lateral and vertical adjustments. A slight settling of the rails or a slight misalignment sideways as a result of strains introduced by wind, settlement of building foundations, overloading of structural framework, etc., frequently causes the tracks to assume an extremely crooked appearance. The writer knows of a case where as much as fourteen inches of settlement occurred and where there was a lateral displacement of nearly eight inches. On this particular crane-way, loads as heavy as twenty tons were being carried, and in order for the crane to navigate at all one rail had been practically freed of all anchorage to its supporting girder, and had even been greased under the flange to permit it to slide sideways and so follow the movements of the crane. Struts, with nuts on the end, held the rails from falling off the girder. The eccentric strains thrown on the frame of the building by this condition and upon the crane, due to a swinging of the load which was thrown out of equilibrium by such movements, was considerable and several serious accidents resulted. Fortunately a change in management furnished an incentive to eliminate these conditions. In another case a crane repeatedly jumped the runway rails at one end until the wheels were found to be of different diameters and so made one end progress farther than the other.

Far too many overhead cranes are used without adequate signs to indicate their safe capacity. The writer recalls a case in which a load, so large that the crane could not lift it, was placed under as much lifting strain as the crane could exert and was then dragged down the length of the shop to its location. Such practices, while they are not frequent, indicate a tendency on the part of the operator to take chances—a tendency probably fostered by his lack of adequate information regarding the capacity of the crane or of the dangers which such treatment introduces.

Wherever the space available in a shop will permit, there should be a free aisle-way from one length of the crane-way to another over which loads may be carried without the necessity of passing over more than a few individuals. There are not many old shops where this is possible, but there should be some portion of the shop specifically kept as free as possible from men and valuable material and machines to permit the crane operator to carry material over such a space without any more hazard than is necessary. When unusual loads are carried over such spaces every individual should be made to stand from under the load.

There are many excellent installations of the highest quality of cranes operating over inadequately illuminated spaces. The fact that the operator is a considerable distance above the floor where the attachments to the crane hook are being made and that he must see through a haze that sometimes develops in shops from product being manufactured in spite of proper ventilation only aggravates an already bad condition. This atmosphere might be a permanent or only a temporary condition. For example, a foundry is very often badly troubled with this haze during a pour, and a machine shop that may be generally clear will become clouded for a portion of the day as a result of a large babbitting operation done inside the shop or from the wafting of smoke or fumes into the shop from other parts of the building or from out-of-doors. On days when natural illumination varies it sometimes happens that the lights are not turned on during the darker periods so that there are periods of comparatively poor illumination from the crane operator's standpoint. In many shops the artificial illumination is not sufficient to afford adequate vision at any time. It may be far too expensive to increase the general illumination for the benefit of a single crane operator, and in such cases, and even when illumination is good, excellent results have been obtained by attaching to the crane trolley one or more lights properly covered with a focussing reflector, and so arranged that the area immediately about the hook when at its lowest point and near the floor is brightly illuminated. Such illumination tends not only to assist the crane man to observe what is being done on the floor, but helps crane attendant to make proper attachments to the load. Furthermore, when such a load is travelling down the shop, the brilliant illumination throws it into bold relief, and it serves as an admirable warning of its approach. In many shops the hook of the crane is painted white and kept white in order that it shall attract attention to itself and furnish some measure of indication to the crane operator of its location with reference to the floor. Where such a hook is illuminated by overhead lights as just suggested, it is very conspicuous.

In many shops lighting fixtures arranged to furnish general illumination of the floor are from necessity, placed above the travel way of the crane. If such buildings have wide spans, the crane operator, unless properly shielded by an awning to his cab, is confronted in his view up and down and frequently across the shop with many spots of brilliant and glaring light that serve to confuse his vision. In some shops this general illumination from above the crane-way is augmented by lamps having angle reflectors, and too often no reflectors at all, placed just below the crane runway. When operating the trolley on the far side of the shop these lamps throw a steady stream of light into the face of the operator, seriously confusing his action. Such lamps should be shielded from above with reference to any posi-

tion the load to be observed by the crane operator must assume.

A person making an examination of any considerable number of overhead travelling cranes is impressed by the fact that so many of them have none of the electrical equipment in the cab properly guarded. There are exposed contact points, circuit breakers, knife switches and terminal lugs carrying from 110 to 500 volts or more. Contact with these exposed points may not only kill a crane operator but may temporarily incapacitate him so that his crane continues its motions uncontrolled. The use of the simplest form of shields or guards composed of asbestos, wood, sheet metal or other material are not only easily applied but inexpensive. The possibility of serious accident in the movement of an uncontrolled crane is sufficiently great to require ample protection for the crane man and new equipment should be specified to have only back-connected control panels and inclosed resistance grids.

Many cranes have practically nothing more than a hand rail to keep the operator in the cab. During his slack moments, when he is comfortably stretched on a box, stool or bench, any lapse of consciousness would permit him to shoot under this rail and fall to the floor below. There is no reason why the crane should not be enclosed to a reasonable height with grillage to prevent such an accident and in a manner that need in no way interfere with the craneman's vision or movements.

Cranes, like all other apparatus, require occasional repairs, and continual maintenance. It strikes one as almost criminal to note the lack of any adequate repair deck over which the crane may be housed and from which oiling, adjustments and repairs may be safely performed. There is scarcely a condition in any shop where such a deck cannot be provided in one end or the other for at least a portion of the width of the crane span. Although there are many heavy parts used in the construction of the trolley of a crane, no provision is made for a small wall crane or a travelling chain hoist to assist in this work. Many times repair men are exposed to serious hazards from falling on account of this lack. It is not infrequently the case that the bottom chords of the roof trusses are used in making repairs and at such times they are subjected to strains which they were never designed to withstand. Workmen are frequently called upon to make crane repairs after dark and to use electric drills or soldering irons in connection with their work. The placing of a few plug receptacles for the attachment of portable extensions to make connections to these tools would greatly assist in this work. Such provisions should be made as parts of a repair deck.

Most cranes are not fitted with an over hoist or over travel stop that automatically arrests the upward travel of the hook and its load if the operator fails to disconnect the power of the hoisting motor as the hook-block approaches the hoisting drum. On large cranes that handle heavy loads the hook travel upward is slow and in many cases the part being hoisted requires a maximum upward travel of the hook. Crane operators have been observed to turn on the power and calmly wait for the load to come into contact with the over travel release, thus disconnecting the motor. The fallacy and danger of such operations are evident and should be matters of strict discipline.

Every crane requires its cable to be lubricated to prevent wear from friction and destruction from rust. While such lubrication accumulates grit and dirt in some shops the advantages of the lubrication tending to give long life to the cable more than offset the damage which this grit may do. The lubrication of the cables is sometimes accomplished by a man standing on the trolley who applies the grease as the cable is wound up. Sometimes the cable is all wound up and the top half of the drum properly greased. The bottom half is then greased after the drum has made a half revolution to bring the ungreased cable into an upward position. The writer recently saw a very clever greasing device which could be temporarily attached to the top of the hoisting block in such a way that an arm holding collar made of soft wicking could project out and surround the cable. This arm was connected with a tank supplying grease in such a way that the cable, by passing through the collar, became properly lubricated throughout its entire length.

In view of the present knowledge concerning crane operation it seems rather trite to mention the fact that so many cranes are operated without a safe or convenient means of access to their cabs. The daily exposure of operators to falling, to contact with live wires, or to being overcome by fumes or gases while climbing to their cabs is considerable. It would seem the part of wisdom that not only new structures, but old structures as well, should be equipped with either a properly enclosed ladder or an adequate stairway from which the cab could be reached with a minimum of risk.

Overhead travelling cranes, and locomotive cranes to an increasing extent, are handling material by means of electro-magnetic lifting devices. These are so ruggedly constructed that they will withstand almost unlimited abuse. The only weak link in their safe operation is the cable connecting them to the source of power or the power supply itself. Usually the power is sufficiently reliable to make failure only a remote possibility. The cable, however, is subjected to all manner of rough handling as a result of following the movements of the magnet and from its contact with the ground, material being handled and, sometimes, with the devices that are used to keep the slack of this cable from fouling itself with the boom. One of the best solutions of this difficulty has been the adoption of a cable which can follow the magnet in the same manner that the lifting cable follows it. If this cable passes over a suitably grooved pulley at the tip of the boom, or on the trolley drum of the crane, and is so arranged that a counterweight will carry the slack down the boom or that it will wind up on the drum of the trolley most of the wear can be avoided. Suitable electrical connections can be made by means of contact with a sliding bar or with a rotary collector ring on the trolley winding drum. A proper application of this device will result in longer life to the cable and avoid all damage due to kinks, cuts, abraisions and strain.

One may still find a tendency to overload crane hooks. While the hazards created by the improper use of chains is well known, and may result in careful handling of them on the part of well-informed operators, there are still a considerable number of floor men who introduce strains in crane hooks which it is impossible for them to stand without serious deformation or breaking. In handling some objects, several chains are used, so that the mouth of the hook is filled and attachments are made to the very tip of the hook in such a way that a severe side bending strain is introduced in addition to the lifting strains introduced by the chains hanging at the bottom of the hook.

The inconvenience attendant upon work performed on overhead cranes and the failure to provide convenient platforms from which to perform such work, has resulted in much neglect of crane repair and upkeep. One of the most noticeable defects is an increase in the amount of play and back-lash that is allowed to develop in all parts of the structure, particularly in the gears. When this is excessive and the gears pound badly, the starting of the motor or its reversal from a raising to a lowering motion introduces strains on pinions, shafts, keys, and other parts sufficient to cause much damage. This wear is very often due to the fact that adequate lubrication has not been furnished because access to the oil and grease cups has been difficult and the person responsible for maintaining the equipment has neglected to do his work because of the difficulty of getting at the places where it must be performed. In some cases this condition has been helped materially, and even overcome by the use of oil cups or compression grease cups serving all parts of the crane and so located that they can all be reached from the crane walkway. It then becomes necessary only to go with an adequate amount of grease or oil to the several conveniently located cups to keep bearings adequately lubricated.

Gantry cranes, wall cranes, and other combinations of hoisting apparatus capable of operation in one or more directions, each has its particular problems, but they have been covered by consideration of similar conditions that occur largely in both locomotive and overhead travelling cranes. There is probably no piece of apparatus that does more to facilitate easy and convenient work than do these various types of cranes, and it seems strange when one considers that so much has already been done to make them safe, that there still remain so many obviously dangerous points at which they could be improved, not only to facilitate their speed of operation but to reduce materially the hazard to the operator himself and to those adjacent to the movements of such cranes.

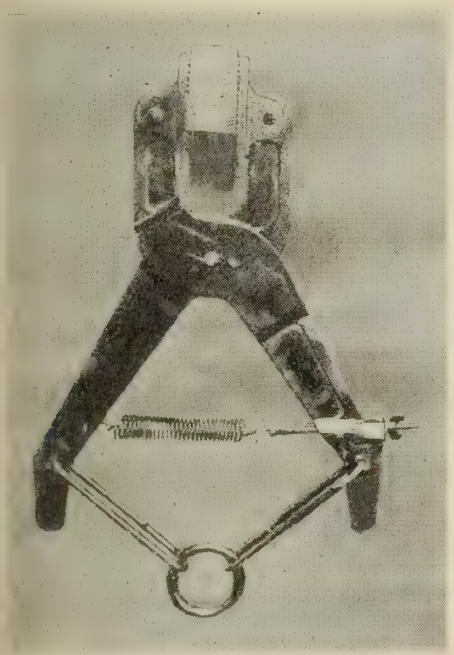
A New and Novel Quick-Action Gripping Hook

Readers Have no Doubt Heard the Old Joke About the Sky Hook, Which You Hitch on to a Passing Cloud. Well, This Isn't a Sky Hook, But You Attach it Almost Anywhere

By J. H. M.

IN commencing this article let it be understood that the author merely presents before readers of CANADIAN MACHINERY a new feature which is useful to shop or garage.

The views accompanying this article were taken in a garage simply because it was not convenient to photograph them elsewhere. We would have preferred these views to show some machine tool plant, but we can at least repeat what the inventor of this novel gripping hook told CANADIAN MACHINERY'S representative.



A DETAIL VIEW OF THE HOOK.

The principle of the idea lies somewhat along the lines of a pair of ice tongs. Fig. 1 shows the grip hook itself, with a piece of timber between the jaws for illustrative purposes.

These hooks are to be made in all sizes up to at least three-ton capacity. The range will be in all probability 1 ton, 2 ton, and 3 ton capacities. So far only the 1 ton size is on the market.

Each jaw is complete in itself, and is made of malleable iron. The two links and ring for the tackle to hook to are made of steel rod welded.

Every grip is tested beyond its capacity before being passed. The advantages of a hook of this nature are claimed to be as follows: On a ceiling with no space between the beams and ceiling it is a difficult matter to attach lifting tackle without first drilling a hole through the beam, placing a stout bolt through this hole and attaching tackle to the bolt.

This procedure takes considerable time. It is in such cases that this hook is used. It will grip on any beam from 1½ inches wide up to 6 inches. The jaws are 5 inches long by 2 inches wide, making a total gripping surface of 20 square inches.

The heavier the weight the tighter the jaws grip. The chief feature is the speed in which it can be placed in position. The user merely pulls the hook open by hand, places over the beam, lets the jaws grip naturally, after which attach block and tackle to the lower ring as shown in photo.

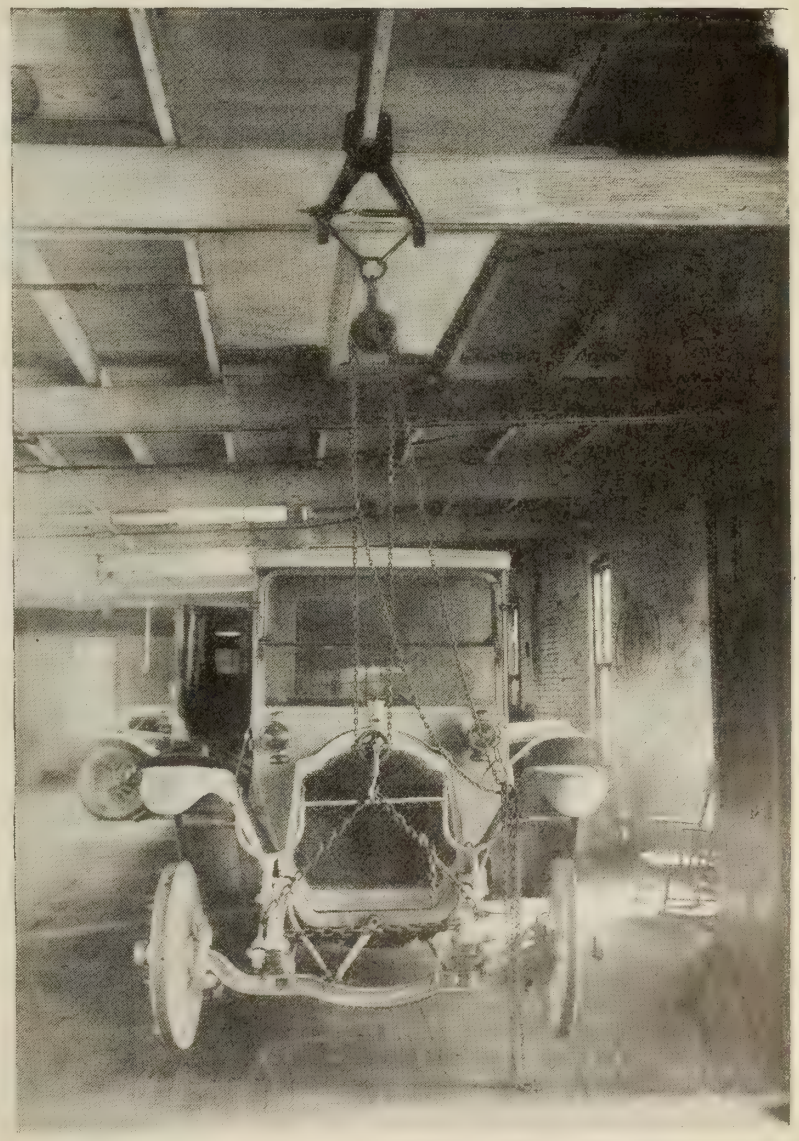
At Fig. 2 we show one of these one-ton blocks raising the forward part of a Packard car from the floor. There is approximately one and a half tons on the hook which is shown in the illustration.

The main use for such attachment is claimed to be in the hanging of shafting for lifting heavy work on the lathes, planer, or other machine tools; in fact for around shop purposes.

The inventors, the Patterson Brothers, of Hamilton, Canada, have patented this hook in both Canada and the United States, and are quite optimistic as to its future possibilities.

Village Constable (to villager who has been knocked down by passing motor-cyclist): You didn't see the number, but could you swear to the man?

Villager: I did, but I don't think e' 'eard me.—Galveston News.



GENERAL VIEW, SHOWING THE HOOK IN USE. THE HOOK IS NOW LIFTING APPROXIMATELY 1½ TONS.

Canadian Machinery Drafting Course—Part V

Geometrical Terms and Meanings With Figures Illustrating Same —Various Kinds of Triangles and Quadrilaterals Defined—Six More Problems Given Together With Explanatory Data—Fifth Plate of the Course

By J. H. MOORE, Associate Editor Canadian Machinery

IN the previous instalment on this very necessary subject we defined certain definitions, up to the point of the obtuse angle, stopping at the aforementioned angle in order to proceed with plate No. 4.

We will now go further into the subject of geometrical terms and their meanings.

Leaving the angles we next come to the subject of surfaces, which prompts the enquiry, "What is a surface?"

A surface is produced by the motion of any line. It always has two dimensions, namely length and breadth.

There is another type of figure termed the plane figure. This could be explained as follows:

A plane figure bounded on all sides by lines (that is, taking it for granted that they are straight lines) is called a polygon, or as sometimes termed, a rectilinear figure.

So now, since we've come to polygons, let us see what various types we find.

A polygon proper is a plane figure which is bounded on all sides by straight lines, these lines being called sides, and the sum of these sides being termed the perimeter, which means the length of the boundary.

These polygons are classed according to the number of sides they have and are as follows:

A triangle is a polygon with three sides; a quadrilateral is a polygon with four sides; a pentagon, with five; a hexagon, with six; a heptagon, with seven; an octagon with eight; a decagon, with ten; a dodecagon, with twelve; an equilateral is a polygon whose sides are all equal. A regular polygon is one all of whose angles and sides are equal.

These definitions describe in full the various type of plane figure met with in geometrical problems, in fact some of those mentioned in the list very seldom appear, but for the student's benefit have been spoken of in order that he may familiarize himself with the names.

Now polygons again can be classified into various headings, in fact such is necessary, so briefly we will proceed to define some of these general headings.

First we come to triangles, namely the polygon, with three sides. The angles of a triangle are of course the angles formed by these sides. Figs. 1 to 6 illustrate the different type of triangles met with. At Fig. 1 we see the right angled triangle, or, as it is commonly termed, the right angle. The longest side of this angle, that is the side opposite the right angle, is called the hypotenuse, the other sides are simply termed sides, or, as some people prefer to say, legs.

Fig. 2, the obtuse angled triangle, is one that has an obtuse angle as shown.

Fig. 3, the acute angled triangle, is one which has all its angles acute.

Fig. 4, the equilateral triangle, is one (as the name denotes) having all its sides equal.

Fig. 5, the isosceles triangle is one, two of whose sides are equal.

The altitude of a triangle is the length of the perpendicular drawn from the vertex to the base, see line A on Fig. 5.

Fig. 6 illustrates the scalene triangle. This triangle has three unequal sides.

The lowest side of a triangle is always called the base. Any side may of course be taken as the base, but usually the side upon which the triangle is supposed to stand is generally accepted as the base.

Quadrilaterals

Polygons are again subdivided into quadrilaterals, or polygons with four sides, of such shape and names as follows:

A quadrilateral is, to commence with, a figure bounded by four straight lines (see Fig. 7).

A parallelogram is a quadrilateral whose opposite sides are parallel (see Fig. 8).

A rectangle is a parallelogram whose angles are all right angles (see Fig. 9).

A square is a parallelogram whose sides are all equal, and whose angles are all right angles (see Fig. 10).

A rhombus is a parallelogram whose sides are equal but whose angles are not right angles (see Fig. 11).

A trapezoid is a quadilateral having only two sides parallel (see Fig. 12).

But enough of definitions in this section, so let us get on to plate No. 5.

As will be noticed, this plate is divided into six problems, each dealing with polygons in one form or another. As before, the dimensions are 9 in. by 13 in. for the border lines, and 9½ in. by 13½ in. for trimming. Divide the 8 in. by 13 in. space into six portions as shown and proceed as follows:

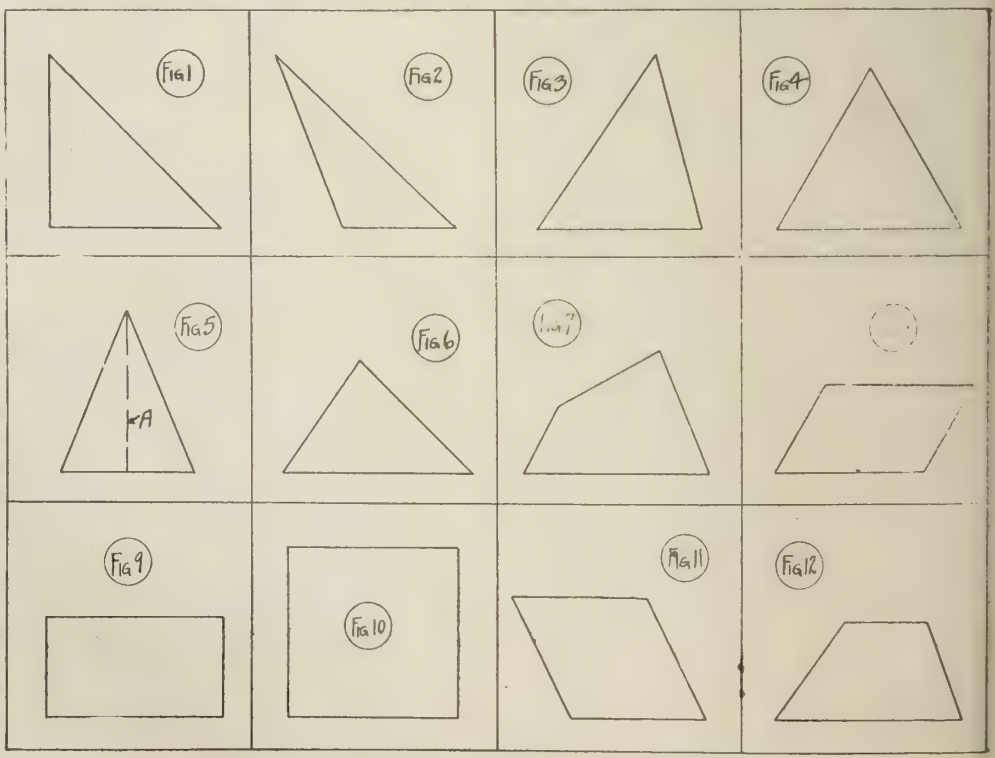
Instructions For Plate 5

Problem 1.—To construct an equilateral triangle, one side being given.

Draw A B 2¾ in. long. With A B as a radius, and A and B as centres, describe two arcs intersecting at C; join CA and CB. The result being an equilateral triangle.

Problem 2.—To construct a parallelogram when the sides and one of the angles are given:

Suppose AB and CD to be the given sides, AB 2¼ in. long, CD 1¾ in. long. Let E be the given angle. Draw FG equal to AB and draw GH, making the angle with FG similar to the angle E.



FIGS. 1 TO 12—SHOWING VARIOUS TYPE POLGONS.

Make the line GH equal in length to CD. With H as a centre and a radius equal to AB, describe an arc at I. With F as a centre and a radius equal to CD, describe an arc cutting at I; join FI and IH, when you have constructed your parallelogram.

Problem 3.—To inscribe a square in a circle:

Draw the circle, as shown, 3 in. diameter; draw next the two diameters AB and CD at right angles to each other; join these points of intersection with the circle, and in short order you have a square completed as shown.

Problem 4.—To inscribe a regular pantagon in a given circle:

Draw the circle as shown 3 in. diameter; draw the two diameters AB and CD as before; consider the centre of the circle as the letter O; bisect OB as shown at E (note: your previous plate gave this problem of bisecting a line). With E as a centre and EC as a radius draw the arc CF, cutting AO at F. With C as a centre and CF as a radius, draw the arc FG, cutting the circumference of the circle at G. The chord GC is one side of the pentagon. The rest of the construction is left to the student, for it is self apparent, the one side being obtained.

Problem.—To describe a regular octagon in a given circle:

With O as a centre describe a circle 3 in. diameter; draw the two diameters AB and CD, bisect angle AD at E, and draw line E to F; bisect the angle AC at G, then draw GOH. Join the points of intersection with the circle and you have your regular octagon constructed.

Problem 6.—To inscribe a regular polygon of any number of sides in a given circle:

With O as a centre draw a circle 2½ in. diameter. Draw the two diameters AB and CD; prolong AB as shown, making AE equal to three-fourths of the radius OA; divide the line CD into as many equal parts as the polygon has sides as shown at 1, 2, 3, 4, 5, 6 and 7. (Of course this can be any number). Now draw a line through points E and 2, cutting the circle at F; draw the chord CF, this is one of the sides of the polygon. Of course the others are easily obtained by spacing off around the circumference.

This completes plate 5. Print in Problem 1, etc., in their proper places, also be sure and print in the title, for it is all good lettering practice. Keep on sending in your plates.

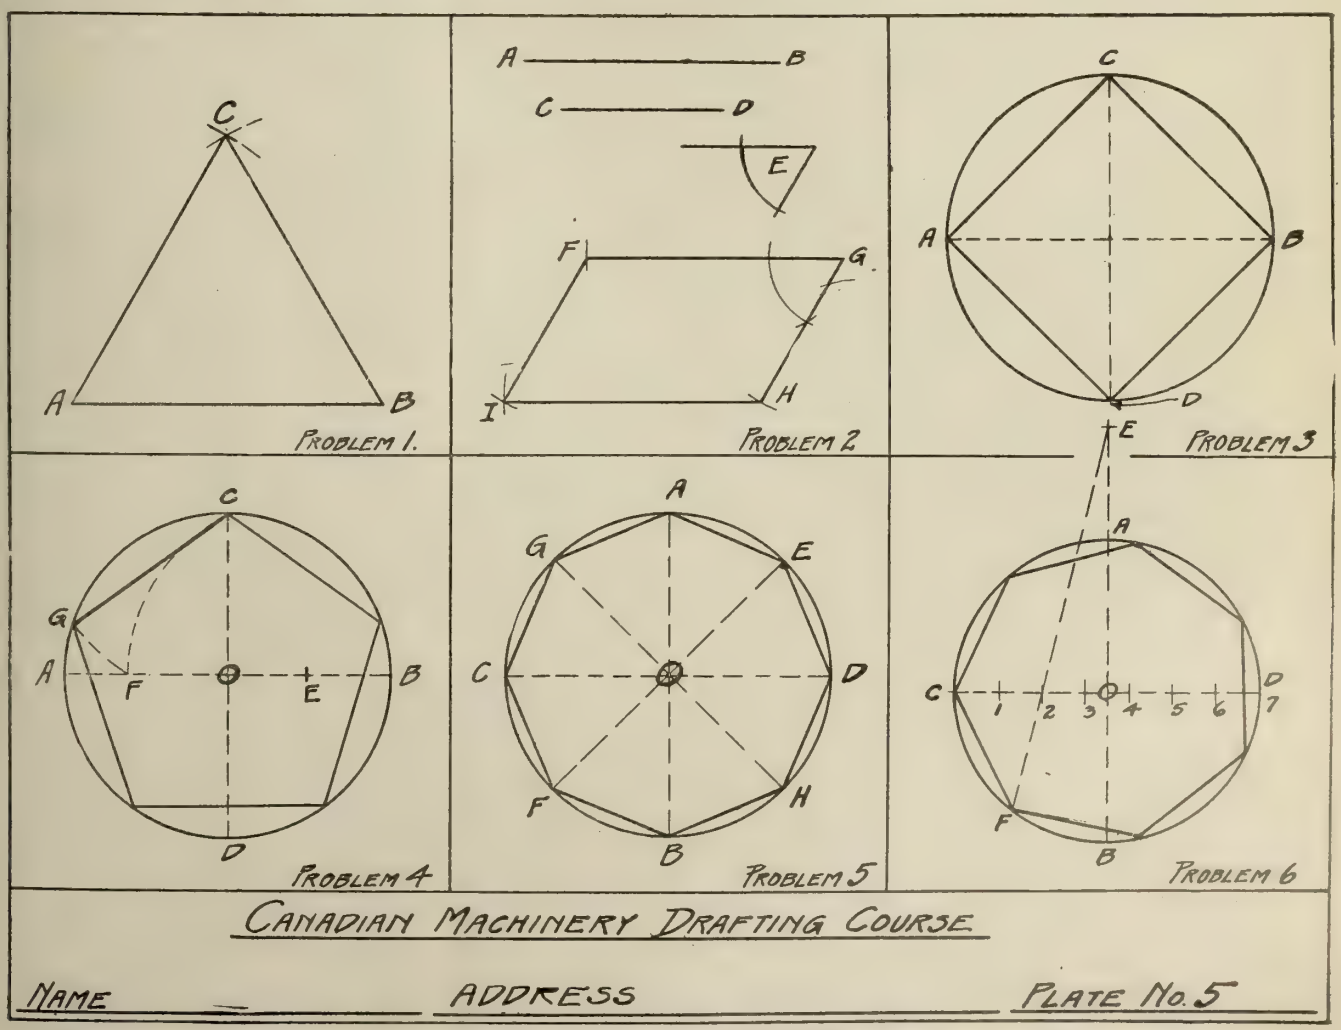
Cleveland.—There is less grain in stock in elevators at the head of lakes than at this time last year. Elevators at Chicago, Duluth and Fort William were holding at last reports 43,920,000 bushels of all kinds of grain, compared with 58,800,000 bushels last year. There has been a good movement from Port Arthur and Fort William recently, and most of this has been carried in Canadian vessels.



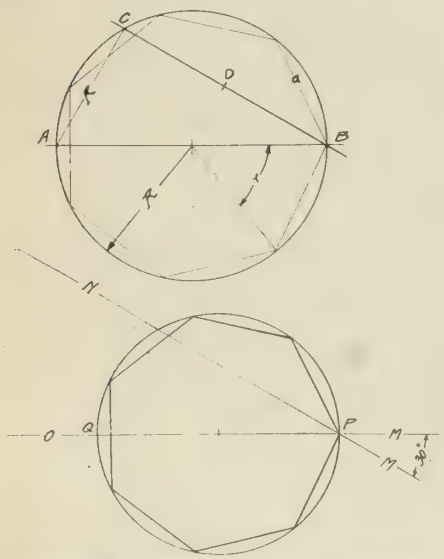
THIS COURSE DEPENDS ON YOUR REPLIES FOR ITS SUCCESS. ARE YOU SENDING ON YOUR WORK REGULARLY?

WHAT OUR READERS THINK AND DO

TO CONSTRUCT A 7-SIDED POLYGON

By Robert Hofstetter

IT IS very evident that readers of CANADIAN MACHINERY are taking keen interest in our drafting course, for from time to time we receive comments upon the same. Here, however, is not only a comment, but a suggestion well worth passing on to other readers who may care to follow up the correspondent's method in place of the one shown in our course, but we shall let the author of this suggestion speak for himself. He writes as follows:



HERE IS MR. HOFSTETTER'S METHOD.

In the CANADIAN MACHINERY Drafting Course Review I noticed on plate 5, problem No. 6, which shows the construction of a 7-sided polygon.

I take the liberty of submitting what I believe to be a simpler construction, as follows:

1. Draw a circle with a radius (R).

2. Draw a diameter of this circle (A-B).

3. From one of the intersections of diameter and circumference (A) draw a chord equal in length to the radius (A-C).

4. Connect the other intersection of diameter and circumference (B) with the intersection of chord and circumference (C).

5. Bisect the distance thus obtained (C-B) and this bisector CD or BD will be found to equal very nearly the side of a 7-sided polygon.

To show the error involved, let us assume a circle of 4 in. diameter and we will have the following relations:

A = length of side of polygon.
N = number of sides of polygon.
V = suspended centre angle.
R = radius of circumscribed circle.

$N = 7 \qquad R = 2$ in.

$V = 360 : N \qquad 360 : 7 = 51°.43$

$$A = R\left(2 \sin \frac{v}{2}\right) = 2 \times 2 \times 0.4339$$

$= 1.7356$ in. length of side.

The right angle relations check out as follows:

$\sqrt{4^2 - 2^2} = \sqrt{12} = 1.7321$ in.

an error of less than four-thousandths of an inch, or very close to two-tenths of 1 per cent.

As it happens, this process is reversible, by which is meant, that the length of the side may be given (in inches for instance) and it is required to construct the 7-sided polygon with this length of side.

The procedure would be as follows:

Draw two intersecting lines (M-N and M-O) at an angle of 30° from the point of intersection P. Step off on MN twice the length of the given side and drop a perpendicular on MO, given a new point of intersection Q. Bisecting the distance, O-P, will be the radius of the circumscribed circle for the desired polygon.

Readers can compare the method shown in our course with Mr. Hofstetter's, and use whatever method appeals to them. This interchange of ideas is just what we desire, not only in the drafting course, but on any other subject.

SELECTING AND TESTING SHOP SUPPLIES

By F. E. Merriman

SO many and rapid are the changes taking place even in quite staple goods that an article best suited to a specific purpose to-day may not fairly lay claim to that distinction a few months later. New styles, kinds and varieties of goods are constantly developed and placed on the market and so demand the continual attention of the manufacturer who would exercise maximum economy in the purchase of his supplies. Furthermore, "quality" is becoming more and more the slogan of the manufacturer and this makes many articles available for use though, heretofore, found unsuitable. This, of course, raises the question of how best to make the selection and how to keep apace with changes, for some knowledge of all improvements is essential to those purchasing.

Manufacturers and buyers are taking note of improvements and developments in their supplies and checking them against their requirements in various ways. The large manufacturer has his testing laboratories and corps to keep him informed of the value of these things, others ignore them and stick to past practice; but many cannot afford the first and are unwilling to follow the other policy. To the manufacturer unable to have a laboratory there are other less expensive, and often equally as efficient, methods open. It is the purpose of this article to discuss a few practical instances of simple, inexpensive, but reliable comparisons of articles and goods of common use in manufacturing plants.

Belting is a material in common use in factories; but concerning the merits of the various kinds there is much prejudice, diversity of opinion and experience. There is, first of all, leather of various makes, tannages and methods of manufacture. Again there are belts which are of woven material and impregnated with various substances, also rubber belts, all having their uses and successful installations. Regarding their relative merits for a particular plant no general conclusion can be drawn, for every plant has a variety of drives and operating conditions to which certain kinds of belting are much better suited than others. The fallacy of expecting to use one kind of belting throughout a factory needs much emphasis, for it is a very common error. Many can be found who will say and believe that leather, or some other particular kind of belting, is the best for all purposes. It is well known high speed steel is better than carbon tool steel for certain places and conditions, but no one would think of recommending it as the best for every purpose. The same is true of beltings, they will have their application. This short discussion has shown that to properly select belting we must first of all understand the general characteristics of the various kinds available. This, of course, calls originally for some kind of a trial and there is none better than a practical application to the various types of drives about the factory. To determine what these types are, requires some knowledge of the factory and some analysis. To illustrate the idea, there are drives where rubbing

occurs, due to belt shifters, drives where the belts run over small pulleys, belts with idlers and tighteners, high or low speed belts, vertical belts, horizontal belts, long and short centre distances between driver and driver pulleys, high and low powered belts, wet surroundings, greasy drives, etc., all common to nearly every factory. All these conditions call for certain common characteristics in belts and qualities necessary for a certain drive may not be at all essential to others. A little study shows what the most important characteristics are. For example, a belt where a shifter is used must successfully resist rubbing on the edges, small pulleys are more destructive than large, because they bend the belt to a greater extent. Excessive moisture or oil, when present, increase the tractive difficulty as do short drives. The horizontal drive is easier than the vertical drive. A practical belt test under such conditions discloses its characteristics in these particulars. It shows that leather resists rubbing on the edges better than belts from woven materials. Also under certain greasy conditions leather will not always do as well as certain other materials.

To obtain a reasonable idea of the value of various kinds of belting need be neither expensive nor yet long drawn out. Drives selected for test should be of sufficient difficulty to disclose the merits of the tested material in a short time. Such a test, when the material fails, often discloses characteristics valuable and sometimes superior for other applications. A brief trial or two of this kind usually furnishes the information necessary to determine where further tests can advantageously be made. Drives where trouble is found often furnish suitable places for a trial. In this connection a warning may well be sounded against too severe a test, for really good material has sometimes been condemned by senseless and unreasonable tests. Common sense is as necessary here as elsewhere.

An illustration of the knowledge gained from a test of this character will be of interest. The drive was from a main line to a countershaft. Considerable power was transmitted and, due to the presence of a clutch, considerable oil was present. It was considered a difficult drive. Oak leather was the initial belt and afterward two woven belts were used on two similar drives with very close to the same conditions. One of the trial belts was of woven material folded to make several plies and finally stitched together and impregnated with a waterproofing substance. The other was woven to the desired thickness in one ply. The results were as follows: The leather belt became saturated with oil and then lost its tractive capacity; the folded and stitched belt ran successfully until the outer ply wore out, including the stitching, the plies then separated and the destruction of the belt soon followed. The third belt was still running in good condition long after the others were useless. It was found that the second belt carried the drive as long as three leather belts and not as long as the third trial belt. The leather belt, however, had a reclaim value not possessed by the woven belts.

Cost of 3 leather belts	$24.62
Reclaim value	14.77
Belting cost	9.85
Cost of folded belt	4.78
Saving over leather belt	5.07
Cost of single ply belt	3.51
Saving over leather belt	6.34

The lesser risk of shut down in the case either of the two belts tested was of considerable value and a still larger balance in their favor could readily be shown.

The success of the instituched belt in this trial suggested its use for a spindle drive on the radial arm of a large drill press where, due to a poorly arranged oiling system, much oil was present. This made it a difficult drive for leather belting. The trial belt here was a success, though the life was not great, due to the destructive effect of the small pulleys used.

Another installation, a wet grinder, proved a leather belt of special tannage, superior to anything else, for it had long life and excellent driving power, notwithstanding the large amount of water present. The other belts were less successful under these circumstances.

These tests all required some time and attention, but most of this was furnished by the millwright foreman, who was easily interested in making the tests. In fact it was the interest on the part of this foreman which was instrumental in carrying the test to a successful conclusion in each case. The point of greatest interest is, however, the fact that the tests were made with no interruption of regular factory operation and at practically no expense. The results were worth many dollars to the firm.

One of the much-mooted questions in many factories is the question of a proper cutting lubricant. Many hold there is nothing equal to a good grade lard oil. Others, however, find an advantage in the use of other fluids. Due to the many variable conditions present such as the operator's opinion, the quality of the cutting tools, the grade and condition of the material worked, etc., definite comparisons of performance are not readily set up. However, an analysis of these conditions will point out what may be called a typical job on which the cutting fluid may be given a trial. The result of such a trial will demonstrate in many instances the value of the goods not only for the job, but also for the usual run of work.

In a certain instance turning and threading nickel steel bolts was selected. A very good thread was required and the work was to fairly close limits. It was found that the behavior of the chasers and the finish of the thread furnished a reliable criterion of the value of the cutting fluid. Based upon this test quite a large saving was effected in the cutting fluid costs and a better quality of work resulted. The deterioration of the machinery and tools was also considerably less.

These instances suffice to indicate the importance of selecting the place and conditions of test before making trial of the goods. The trial should be selected in such a manner as to afford as clear cut a comparison as possible of the materials tested and as wide application to other conditions as may be practical. In fact this initial selection is of the greatest importance. Tests on a large scale are necessarily expensive, often cause much interruption and frequently afford no tangible results. Restricted tests wisely selected and interpreted can usually be made to afford sufficient information for all practical purposes.

By such methods and principles of trying out and selecting the many kinds of supplies used in every factory may be purchased to an increased advantage.

READERS, ATTENTION!

Every week that you read these pages, is there not some stunt or idea that crosses your mind, some scheme you used with good success in your experience? Of course you think of these things as you read the various devices shown in this section, but—it's a big one—do you follow out your thoughts by sending us in your ideas? If you do, well, you're one of the wise ones. If you don't, there is something wrong. We pay good space rates for acceptable material and are always glad to consider your work. Granted that you may not be much of an artist, but send us a rough sketch anyhow; we will do the rest. Once more let us repeat: "Send us your work for consideration."

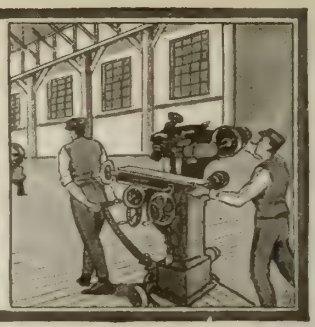
ALUMINUM WELDING A LARGE HOLE

The "Journal of Acetylene Welding" says that when the welding of a large hole is required a chill of galvanized iron is provided, backing up the hole and welding against this when filling the hole with aluminum. Galvanized iron is preferable to any other material, such as tin or iron, since it peels away from the aluminum quite readily, and can therefore easily be removed after the weld has been completed. This is undoubtedly due to the zinc content of the galvanizing composition.

The chief value of the use of the chill is that it causes the filler to cool and harden prematurely, thereby preventing it from contracting after the weld is finished. It also prevents the heat of the weld from spreading, which might cause the job to crack back.

The chill causes the added metal to cool almost as fast as it is connected to the edge of the break. After the weld has been finished and cooled, the chill can be removed by gently prying it away from the weld by means of a cold chisel.

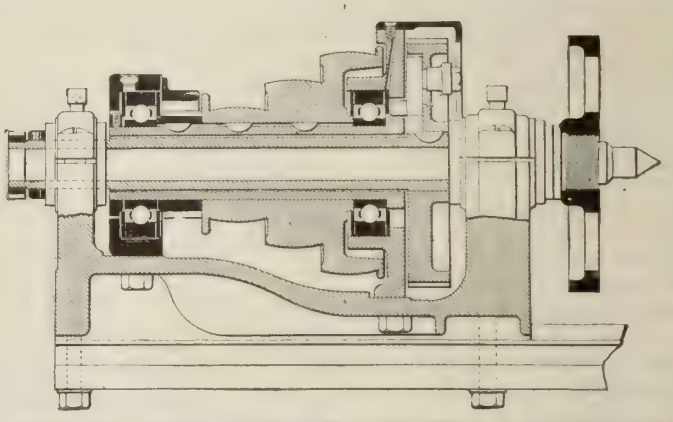
DEVELOPMENTS IN SHOP EQUIPMENT



FLATHER 7-IN. MANUFACTURING LATHE WITH BALL-BEARING CONE

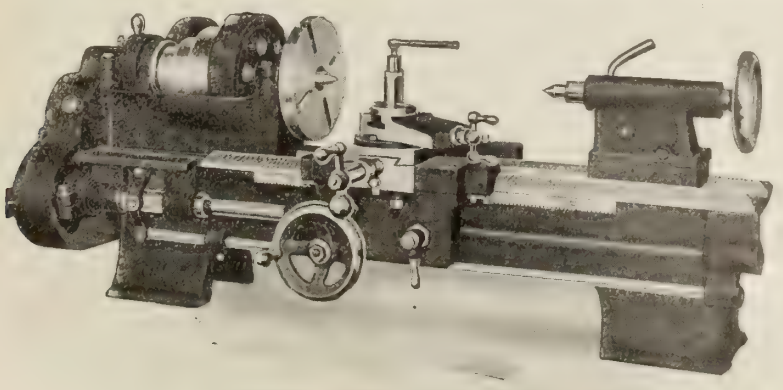
The Flather Manufacturing Co., Nashua, N. H., is now marketing a new 7-in. manufacturing lathe that has unusual features in that the cone is mounted on a set of ball bearings, while the spindle is of the floating type mounted on separate bronze bearings. Fig. 2 shows the design of the headstock. The machine is a manufacturing lathe and has been designed to supply the demand by manufacturers and toolmakers for a standard, rigid, compact, high-speed, screw-cutting engine lathe for accurate work within its capacity, which is about 8 in. over the ways and 15 in. between centres, with a bed length of 36 in. The bed is broad and deep, is braced with cross webs and has bench legs cast integral. In case it is desired to use the machine as a floor type, it can be bolted directly to a pan and legs that can be supplied. All beds are planed and scraped to receive the taper attachments, which are interchangeable on any of the machines.

The headstock has long bearings on the bed and is webbed. The spindle is of high-carbon steel with a ¾-in. hole bored through to accommodate a draw-in chuck with collets up to ½ in. in diameter. The front end of the spindle is reamed to a Morse taper. The spindle bearings are of special bronze, and the cone, which runs on its own ball bearings, is for a 1¼-in. belt. This cone is mounted on bearings held in separate housings from those carrying the spindle boxes. This method of construction allows the spindle to run freely and takes all belt pull off the spindle bearings. Pack gears are provided, the ratio being 7 to 1.



SECTIONAL VIEW OF HEADSTOCK SHOWING BALL BEARINGS.

The carriage and apron are heavy, the carriage being arranged with long bearings and felt wipers. A feed stop is incorporated that can be set for any length of feed, this stop automatically disengaging the feed clutch when the required length has been reached. The lead screw is held by a middle bearing on which the step nut acts, leaving the screw free at the back end for expansion and contraction. The nut is of cast iron, and is operated by a cam milled to allow the nut to be closed firmly on the screw. The cross slide is graduated for adjusting the compound rest and the cross-feed nut is so arranged that it does not have to be disconnected when using the taper attachment. A countershaft of the two-speed, double-friction type is furnished and is operated by double toggle joints.



GENERAL VIEW OF FLATHER 7" LATHE.

JOHANSSON GAUGES AND FIXTURES

After an absence of thirty-five years, C. E. Johansson has returned to this country, bringing with him from his Eskilstuna factory in Sweden some special precision instruments to supplement and broaden the scope of his standard blocks, which are marketed here by C. E. Johansson, Inc., 245 West 55th St., New York City.

The set of angle blocks shown in Fig.

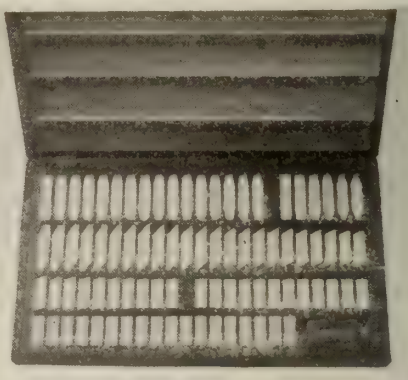


FIG. 1—THE COMPLETE SET OF ANGLE BLOCKS.

1 is probably the one of these new instruments which seems to have the widest field. This set is about the same size as the standard set of size blocks, but each block, instead of having parallel edges, has each of the four corners beveled off at a different angle. The angles have been so worked out that combinations from 1 min. of arc to 270 deg., varying by minutes, are possible. These blocks can be combined with the regular size blocks for making gauges for angular formed cutters, checking sine bars, etc.

Another set of blocks, Fig. 2, is of more interest to the scientist than to the manufacturer or toolroom foreman. The set consists of 11 flat size blocks claimed to vary by equal amounts from

0.100000 in. to 0.100010 in. As to just how one would use these blocks so that they would not be affected by the warmth of the body of the operator does not seem very apparent, but the scientist who may use them will undoubtedly devise a means.

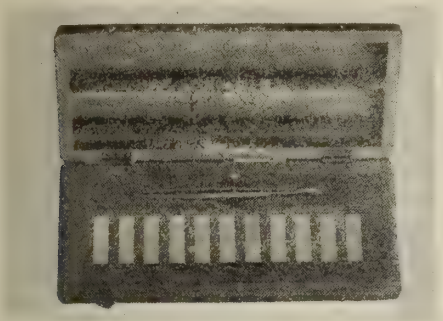

FIG. 2—A SET OF BLOCKS OF PARTICULAR INTEREST TO THE SCIENTIST.

Fig. 3 shows a laying-out and locating fixture for use in combination with Johansson size blocks. The two movable beds are shifted by accurately cut screws ending in the large knurled nuts shown, and the size blocks are inserted between a carefully finished surface on the lower table and plug in the upper one. This fixture lends itself to a variety of uses in the shop and toolroom where quick and accurate work involving close measurements is to be done.

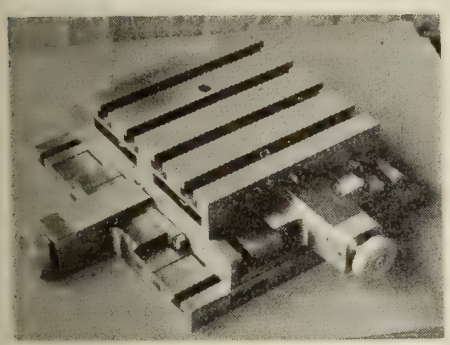

FIG. 3—A LAYOUT AND LOCATING FIXTURE USED IN CONJUNCTION WITH JOHANSSON SIZE BLOCKS.

"FULFLO" REVERSING PUMP

The Fulflo Pump Co., Blanchester, Ohio, has just placed on the market the reversing centrifugal pump illustrated. Its design includes the prime-retaining, non-clogging features of the other pumps of this line with the reversing feature in addition.

The ability to reverse the flow of water or coolant through the pump is obtained through the design of the impeller blades and the introduction of a bronze deflecting gate in the discharge passage. As both openings are at the top of the pump it is always primed and will immediately start the flow of the liquid in either direction, depending on the direction of rotation of the driving pulley.

The pad for mounting the pump is detachable and may be located in any one of three positions at 90 deg. to each other. It is fastened by two flush-head screws.

As regularly furnished with ¾-in. pipe, the pump has a capacity of 15 gal. per minute with a 15-in. suction lift against a 4-ft. head at a pulley speed of 450 r.p.m. When equipped with 1-in. piping the discharge can be easily increased. Variation of the pulley speed naturally varies the output of the pump.

STANDARD ROTARY END-HEATING FURNACE

The rotary end-heating furnace shown in the illustration is a recent product of the Standard Fuel Engineering Co., 1646 Woodward Ave., Detroit, Mich., and is intended for heating for hardening the ends of tools and other steel parts in which a local application of heat is desired. The lower part of the furnace body consists of a revolving table on which the pieces to be heated are to be laid, the ends projecting into the heating chamber. The operator stands in front of the furnace where one segment of the heating chamber is removed and deposits the pieces to be heated on the table and removes each piece as it emerges from the furnace after its rotary travel around the heating space. In the illustration the driving mechanism is shown at the front of the furnace in order to show its construction, but this is turned around to rear out of the way when the machine is in use. Small tools or other pieces of steel may be heated all over by placing them on that part of the hearth that travels through the heating chamber. The heating chamber itself has a vertical cross-section of 4 in. wide and 4¾ in. high, and the height of the opening through which the tools project into the furnace is 1¼ in. The height to the table is 36 in. and the cutside diameter of the machine is 45 in.

Site for New Dock.—The Federal Government have located a site for the new dry dock they are going to build in Esquimalt. The negotiations have been extended over several weeks, and the position chosen is Skinner's Cove, Esquimalt.

Canada Should Take Notice

THE strike fever that has seized United States may bring home to Canada a lesson that must be learned, namely, that this country must become more self-contained. Should the coal strike become serious, we will suffer, and the steel strike has already gone far enough to look dangerous to Canadian industry.

When things are going well we are too apt to regard it as a very easy matter to bring steel and coal across at a price that is hard to overtake here. As things are shaping at present, industrial Canada is liable to become indirectly the victim of all the agitations carried on by the foreign labor leaders in United States.

Having our supplies of coal and a great deal of our steel at the mercy of the radical labor element in the States is a condition that, in view of the great resources of this land, we cannot face with any degree of complacency.

Were soft coal shut off completely, United States would suffer more industrially than Canada by reason of the great advances made here with water power development. But we are still in the market for U. S. coal, as the records of our imports show. For twelve months, ending March, 1919, we imported in coal, coke and charcoal a total of 78,913,921 tons, and every bit of this, with the exception of 2,824 tons, came from United States.

To get some idea of the amount of finished steel and iron coming to this country, the Government reports for twelve months, ending with March of this year, show an importation of 5,376,931 tons of plate.

In sheets the tonnage from United States amounted to 6,058,316 tons.

Of pig iron approximately 2,000,000 tons.

Angles, beams, etc., for ships, 8,324,780 tons.

These items are only a few, taken for the sake of showing the extent to which this country depends on the coal mining and steel and iron making industries of United States.

The growth of labor trouble in United States, where there is such a large percentage of foreigners in these basic industries, makes it increasingly urgent that Canada should think seriously along these lines.

If this country, as well as suffering from its own labor troubles, is going to become a fellow sufferer every time the labor leaders of United States call "strike," it is high time we laid our hands on our own great natural resources, and seriously undertook the task of discounting the great distances that at present separate our coal and ore bodies from the industrial sections of Canada.

The Strike of the Miners

THE spectacle of half a million miners quitting work on the eve of winter because they failed to make a new agreement with the operators is mighty poor entertainment.

The miners and operators were in conference for four days, during which the chief pastime was getting an alibi ready when it came to fixing responsibility for freezing the public.

The man who, in the long run, pays the shot for the outcome of all these wrangling and talkfests is the consumer.

The present strike is just another of "the public be damned" incidents that are becoming so common as to excite no comment.

As far as the consumer is concerned, the miners and operators have made one fine mess of coal mining in Western Canada and in the regions across the border.

We are fast approaching a state where the little man, the consumer, will be told in trombone tones, when he mentions his rights as a citizen, "You aint got any."

Apart from that it looks as though the troubles of the United States were far from settled.

Their production is bound to suffer in all lines. Whether some mild form of Bolshevism has gained a footing is hard to state. But to be honest and blunt, it looks like it.

The Use of Time Clock

WHEELS move within wheels. A few years ago when nine or ten hours was the day's work, time clocks were usually at the entrance to the factory, and anything from three to five minutes from the various departments.

With the coming of the eight or seven and a half hour day, these clocks have been moved and multiplied and the rule is, in most cases, that actual operations shall start at the time when the employee used to enter the shop.

The sale of time clocks has grown enormously with the shortening of hours, due to a desire of the management to combat the tendency toward decreased production by securing continuous effort every minute the man is in the shop.

The use of time-recording instruments is fair to all concerned. They save many a squabble for the timekeeper, and they are now made with such precision that their record can be accepted without question.

Back to Standard Time

STANDARD time is having its innings once more, much to the relief of all concerned.

There are cases where the change works advantageously, and there are cases where it will not work at all.

On the whole, it is hard to see where there is enough advantage to warrant the change.

It has yet to be shown that we can make any great improvement in affairs by tinkering with the clocks.

There are numerous cases where the same end can be achieved by buying an alarm clock and being about early in the morning.

There are plenty of things a hundred times bigger for the Federal House to bother with than having a session at clock tinkering.

The Gold and the Dross

PARTICULARS of a will probated in an Ontario court were published, along with others, a few days ago. There were a number of so-called securities left to the widow and children. To look at the lot it might be supposed that they represented a fairly good living for some years to come.

But get under the surface. They were doubtful industrials, a few mining stocks, cash in the bank and some Victory bonds. The total in figures of the stocks looked big beside the size of the Victory bond holdings, but in actual worth the investment in bonds was worth more to the family in trouble than all the others combined. They were of doubtful value. They might have been bought with the idea of a quick sale, but the man who was going to attend to this had been called, and no one knew his plans.

But there were the Victory bonds. They were just as good with the purchaser of them away as with him there to look after them.

That is the big point in the Victory Loan campaign that is on now. Every cent gets you something real. Something that has more security behind it than a first mortgage, or a municipal or bank bond. It is such a good investment that all that is necessary is that it should be offered to the Canadian people. The chance to "get in" on such a security does not come often to the small investor.

A Mighty Poor Exhibition

UNITED STATES authorities have a small conception of the use of police and militia, when they call on them to stand guard while a grand opera company bawls out a few scores of German song in New York.

Mounted police charged a crowd that threatened to clean out a playhouse in New York where some of this German gibberish was being staged.

In the fracas that followed one man, a sailor, had his head split and was rushed to the hospital in dying condition.

All honor to the U.S. troops that had their heads split in fighting to keep German civilization from sprawling itself all over Europe.

But there's no honor in calling out U.S. cops to crack heads so that German songs may be sung in a land where homes are saddened by the acts of German murderers at sea.

If United States cannot get enough songs sung to it without dabbling in German songsters, let United States go empty for song.

The spectacle of U.S. police battling indignant citizens in order to protect German opera in New York is a mighty thin and white-livered sequel to hang up against the bravery and devotion that U.S. men showed on the Western front.

National Salesmanship

IF Canadian manufacturers are to get into the markets of the world, their products must be better known than at present.

Inquiry made by CANADIAN MACHINERY of many large firms of importers in Australia, South Africa, Sweden, etc., brings out the information that Canadian products are not well known. The answers received contained the admission in several cases that the firms were not familiar with lines made in Canada.

It would be of more assistance to Canadian export trade to have the Trade and Commerce Department give some help in this direction than to have tariffs heaped on until they were in the prohibitory class.

There is a big opening in the world to-day for many things Canada can make, but people in South Africa or Australia, or in a dozen other parts of the world are not going to trot over this country and wander from town to town finding out what we want to sell them.

Canada needs an injection of national salesmanship more than she needs anything else in the way of industrial encouragement from the Government or any of its branches.

A Joyful Thought

There is a keen, a subtle joy, in autumn's cooling clime, that makes it quite a pleasure to tear off yards of rhyme. We sing no more of summer days, of rivers or of lakes, of squattin' on a piece of rock just where the breaker breaks.

Nor yet of strips of wooded land, of cottages nor camps, with a hundred bugs and spiders and a dozen kinds of ants.

Begone such things, there, flee away, you're but a memory now—likewise the country scenes as well of piglets and of cow. We think of sterner things this month, of taxes and of coal, there's window sash and double doors to rend and vex the soul.

And underwear as thick as pie, it costs like silk and plush, to cover up the system from the snow flakes and the slush. But let us sing in joyful way, oh cheery be our tune—and blast it out at morning time, and then again at noon.

While seasons come and seasons go, there's recompense for each, the spring time has its budding tree, the fall its squash and peach. But, ah, to us, the thing that is of all things wondrous fine, concerneth not the things we see, nor things on which we dine.

We blush almost with modest joy to mention this here thing, of which we're moved upon this day to versify and sing. But when the warming rays of Sol get on their northern slants, your winter coat will cover up the patches on your pants.—ARK.

AN ITEM appears in a contemporary, stating that the construction of a steel ship of 6,500 tons is about to be commenced in the Three Rivers shipyard. This vessel is claimed to be the largest steel ship ever built in a Canadian shipyard. This is not the fact. There have been a number of steel vessels built on the St. Lawrence and on the Pacific coast of Canada much larger than this, while contracts have been let for steel ships of 10,500 tons, and the keels actually laid. We are speaking, of course, in terms of deadweight, and we take it our contemporary is using the same measurement. If, however, they are speaking of tons gross, the vessel will not be the largest ever laid down in Canada, as the deadweight capacity would only be 9,700 tons, as against 10,500 tons being built in Nova Scotia.

MARKET DEVELOPMENTS

Shipments from Strike Zone Are Not Good

In Some Lines No Material Has Come Across for Several Days—Premiums Are Being Secured by Some of the Jobbers Who Have Material on Hand—Scrap Markets Are Uncertain

ALTHOUGH it is claimed by the steel mills of United States that the strike there is being broken, and that gains are being made in the list of the mills producing, it can be said that the result is not to be noticed in the shipments that are coming across the line. Of course, there are cases where delivery is fair, but in others the material is not in sight. Warehouses have been cleaned out of several lines, and it is not an uncommon thing now to hear of premiums being paid for certain much-wanted lines. In particular these are sheets and plate, one warehousing firm stating this week that they did not even have a piece of galvanized iron that they could hand over to a good customer as a sample. When it is stated that for the year ending with March of this year this country imported 5,376,931 tons of plate from United States, it is easy to see that a fifty per cent. interruption in such a volume of business for any length of time is going to run into a lot of material. This volume also represents actual requirements, as there has been very little material purchased in this country for stock purposes in the last few months.

The big steel companies doing business in this country seem to have set their faces against any increases in prices, and when this takes place it is after the jobbers have secured the material and are reselling. Another feature that tends to aggravate the situation is that when mills that are operating get hopelessly booked up they withdraw from the market, thus making it harder to get any responsible place to take business with any chance of delivery. First quarter 1920 selling is going on here with the distinct understanding that deliveries are subject to strike conditions.

Machinery sales are holding up well, but nearly all are to be traced to the auto industry, or to interests that have taken contracts for the production of parts. One standard line of lathes this week notified the trade of a ten per cent. increase, bringing the machine to above the war prices.

Uncertainty seems to settle on the scrap metal market. Coppers are not showing strength, probably because second quarter 1920 copper is quoted now below present figures. Some material is coming from the Old Country to Canada for resale in United States.

SHIPMENTS OF MATERIAL HAVE NOT BETTERED AT MONTREAL

Special to CANADIAN MACHINERY.

MONTREAL, Que., Oct. 29.—The local situation has reflected the near approach of the Victory Loan campaign, and also the fact that the Prince will spend the current week in Montreal. These incidents have not interfered with the regular run of business, but the interest displayed has detracted from other matters. The general undertone, as gathered from information obtained from dealers and manufacturers, is one of gradual improvement and increasing activity. There is a steady demand for many commodities, and although the requirements are not always large, the movement is steady and regular, in most cases. The inquiries for used equipment is gradually falling off, largely because the supply is decreasing. Sales of new material are becoming more pronounced. The factor of the delivery is an interesting one, as delays are frequently experienced when goods are brought in from the states. While we are given to understand that the situation, as regards the steel strike in the States, is improving and that mills are operating close to normal, there is nevertheless an atmosphere of uncertainty surrounding the steel market. While the situation here does not seriously reflect the curtailment of steel that must have resulted by the shut-down of the mills, the reports would imply that the situation is not yet entirely satisfactory. It may be true that the production is ample to meet the demands, but in such cases as tubes and sheets, the delivery to local dealers is still of uncertain character.

Unchanged Metal Market

There is little to report in the metal situation, other than that a steady business is still carried on, but of light volume. The strike of steel workers has had a little indirect influence on the metal market but this is becoming less pronounced. The general demand is for small regular supplies, and quotations are firm and unchanged. (Through a printer's error, last week's metal quotations were not altered to conform to the changes mentioned in the Montreal letter.)

Machine Tools Moving Steadily

The machine tool situation is much the same as that of the past several weeks, with the general sales of fair volume and wide distribution. There appears to be less used equipment available just now, and in many respects the current demand leans more to new tools. One feature of present activity is the demand for different size motors, much of which is for used machines. In one instance a local firm made a sale in the neighborhood of $15,000 for used motors and generators. Tool dealers are favorably impressed with the movement of equipment and are generally optimistic on the possibilities of winter business, many believing that the coming year will develop an extremely good demand for every class of machine tool equipment. There is a good demand for supplies, but in some regards the maker may be classed as a competitor of the dealer, as the manufacturer in many instances are selling direct to the consumers, so that the dealer must be content with smaller profits when making sales.

Scrap Moves Moderately

Little activity has been apparent in the movement of scrap during the week and dealers reports are to the effect that the bulk of present buying, which in the aggregate is comparatively light, is of a conservative character, as few future sales are recorded. Local foundries are steady purchasers for small regular supplies. The market may be qualified as nominal, and price quotations are more of a guide than to the actual figures that would apply for a definite sale. The prices quoted, however, are a fair average of what the dealers will offer.

SHIPMENTS DO NOT SHOW IMPROVEMENT

And Firms Depending on U. S. For Raw Material Are Having an Anxious Time

TORONTO, October 29.—Although very few complaints have been made openly so far, it seems increasingly certain that the United States steel strike is going to result in stinted supplies for certain important Canadian factories. Shipments are coming through very poorly, and the stocks in this country are not in shape to provide anything like a reserve to draw from.

There is a nice volume of business going in nearly every department. Warehouses (where they have the material), machine tool and small tool dealers, and scrap metal yards are handling a fair amount of trade in spite of the fact that shipment to United States points is largely held up.

The Steel Situation

There has been a great buying movement in this corner of Canada for the last three weeks or so in the lines that are usually carried in the warehouse business. The prospects of the strike coming on created something like a small panic. For a long time before that there had been no haste to get into the market, although dealers and mills advised the trade many times that nothing at all was going to be gained by staying out to look for better prices. The result was that stocks were low when the strike came, and there was an immediate rush to gather up anything that was available. There could be only one result, and that has come to pass, viz., many of the warehouses now have little or nothing to offer to the trade.

The gains of mills turning again to production in the strike zone are very slow. Those mills that have been operating steadily have been smothered with an avalanche of orders, so large that in many cases they are now withdrawing from the market, leaving the would-be buyer with no place to put his business. One Toronto concern tried several times to have business transferred from a booked-up mill to one that might take on more orders, but was unsuccessful.

"There has been a tremendous warehouse trade in the last four or five weeks," stated one of the dealers to CANADIAN MACHINERY to-day, "but the trouble comes now when we want to buy for our own stock, we can get nothing at all."

A very fair shipment of boiler tubes arrived this morning. They weer assorted sizes, from two to four inch. They have been much wanted for some time, and their arrival was none too soon.

It is the opinion of several very close to the trade that the shortage of supplies is certain to be felt in some circles before very long. Automobile, shipbuilding and agricultural industries are doing a lot of buying just now, and it is only natural to suppose that they will be among the first to feel the results of the trouble across the line.

Stocks of sheets are practically cleaned out. Gauges such as 14 and 16 are wiped off in some of the warehouses in Toronto.

"How about galvanized?" queried CANADIAN MACHINERY.

"We haven't a sheet that we could give you as a sample," was the prompt and emphatic reply.

As a matter of fact the filling of orders is a matter of some difficulty just now, and transferring of odd lots of stock from jobber to jobber is being done at more or less of a premium. It is another case where the price has not very much to do with the business at all. It is more a case of getting the material than haggling over the price that is to be paid for it.

Reports seem to differ as to the amount of material that is coming through from the mills in the strike zone. Some places the reports are that for almost a week now they have not seen a shipment of sheets or plates getting across, nor can they find out that they have anything on the way. In other places the reports are more encouraging, and the claim is made that the amount of material coming across is showing an increase. Advices indicated that a considerable tonnage for Canada has been rolled but cannot be sent away from the mills on account of the shortage of labor necessary to load the material.

Business that is being booked now for first quarter steel is being made very plainly subject to strike conditions by the sellers here.

POINTS IN WEEK'S MARKETING NOTES

The United States coal strike, if not prevented, will mean a shut-down for many of the Canadian as well as U. S. plants.

—

Japan is buying machinery for making automobiles in that country.

—

In New York one dealer took in thirty used lathes and sold them in a week.

—

Delivery is of greater concern than price in machine tools at the present time.

—

Shipments of sheet and plate coming to Canada are not improving, and a shortage of raw material is anticipated.

—

Recovery in production at the U. S. steel mills proceeds very slowly, and many mills that are operating become so booked up that they have withdrawn from the market for the time being.

The Machine Tool Market

Canadian machine tol men who have been through the shops of several machine tool builders in the United States report that in nearly every case they are booked ahead. Stock orders are practically unknown now, and deliveries are not improving. They are as a general thing from one to two months off. The interests in United States that are doing the bulk of the buying are following closely the same lines as in this country, and are headed by the automobile business.

One of the standard lines of lathes has announced a 10 per cent. increase, but otherwise prices are holding at the same mark that has been quoted previously. Dealers and salesmen are hoping they stay there for a time.

The movement in used machinery is brisk, and a fair stock of these, which have been rebuilt and overhauled, are arriving in some of the warehouses in the city.

The Scrap Metal Market

Coppers are not showing any particular strength. In fact there is a decided uncertainty in the whole situation at the present moment. This is probably due to the quotations that are given in New York now for No. 1 standard ingot copper for second quarter of 1920, for 21½c. Trade must look for cheaper markets and plentiful supplies, else that quotation would never have a chance to be made. This has a tendency to flatten out business in the scrap market in these lines. Lead is fairly strong, spelter is holding about the same.

Conditions are rather chaotic in the scrap market for the moment, and it is only fair to say that the figures given in our price list are more or less nominal. Some buyers might be willing to take on anything in the list at the price, while in other places the same offerings would be discounted. The strikes and the general feeling of unrest in United States keeps the buyers there out of the market, although it is a fact that some tonnage is now coming from the Old Country to Canada, and from here sold to United States.

The whites are strong in the market now. Stove plate and agricultural scrap are wanted, and the chances are that there may be an improvement noted in the prices that will be paid for some of these latter lines.

ONE DEALER DISPOSED OF THIRTY USED LATHES INSIDE OF A WEEK

Special to CANADIAN MACHINERY.

NEW YORK, Oct. 30, 1919.—Pending and threatened labor troubles have not had much effect upon machine-tool trade. Some sellers, however, note a slight falling off in inquiries during the past week. The bituminous coal strike, called for Nov. 1, if not prevented by the Government, will result in the closing down of many industrial plants, and it is to be expected that this will cause some hesitation in buying. The best deliveries that can be obtained on many lines of machine tools are from two to four months, so a considerable part of present business is being placed so as to insure delivery at a time when industrial skies presumably will have cleared.

The General Electric Co. has bought considerable new equipment for its Lynn, Mass., plant and is about to close on about tools for its Schenectady works. A new list will be issued by this company soon covering complete equipment for a new shop at Schenectady. The E. W. Bliss Co., Brooklyn, N.Y., manufacturer of presses and other sheet metal working tools, has been a large buyer, its purchases totalling from $300,000 to $400,000. Among its requirements were about 15 heavy planers, also slotters, boring mills, etc. One large planer cost $40,000. The American Car & Foundry Co. is in the market for a considerable amount of equipment for its various plants. Purchases are being made from the company's New York office. The New Departure Mfg. Co., Bristol, Conn., a subsidiary of the General Motors Corporation, is starting to buy on a list of several hundred tools.

In the export trade comparatively little is being done. Some orders have been placed for Japan, notably for an automobile manufacturing plant in that country. European business, however, is almost at a standstill owing to the exchange situation, and exporters continue to hear of sales of German tools in Europe at prices with which American builders cannot compete. Germany derives an advantage, of course, from the low value of the mark.

Second-hand machinery business is very good, and the amount of such equipment that is being absorbed is somewhat surprising. A dealer in used machines a few days ago purchased 30 turret lathes and had disposed of them in different parts of the country within a week.

Prices have not changed within the last few weeks. Buyers now pay very little attention to price, delivery being the chief consideration. Machine-tool sellers who can make the best deliveries are, as a rule, getting the business.

ORDERS FOR STEEL ARE PILING UP AND PREMIUMS ARE FREQUENT NOW

Special to CANADIAN MACHINERY.

PITTSBURGH, October 30.—The rate of recession of the iron and steel strike continues to be a very slow one, though it has improved a trifle in the past week or two. While production was down to about 50 per cent., taking the steel industry as a whole, at the middle of the first week of the strike, it is now, after five weeks of strike, fully 60 per cent. Gains of two or three per cent. a week, however, are very small, considering that the strike, through its own efforts, never had a chance of winning when the first week showed that it could not close more than half the industry.

There has been a theory that the strike was being kept going by hopes of intervention from Washington. If so, that hope must now be gone. The Senate committee on education and labor, which investigated the strike, concluded that the strike was almost wholly by the foreign-born, ignorant of the language of the country, and decided to urge legislation to Americanize foreigners. The labor or industrial conference, which had been urged to take up the steel strike, is disbanded. Wednesday, October 22, the labor group bolted because its resolution favoring collective bargaining was not adopted. President Wilson then asked the public group to continue the work, thus politely relieving the employers' group from further activity, but after a couple of days the public group concluded it could do nothing, and disbanded. So far as Pittsburgh opinion is concerned, the failure of the conference created no surprise. There had been much doubt whether such a conference would get anywhere.

It is too soon to observe whether the collapse of the labor conference is going to cause the strike to crumble more rapidly. It must be remembered that labor was in rather short supply in the iron and steel industry before the strike, and even with the strike entirely over the mills are likely to be somewhat short of men. Furthermore, the strike has been causing much moving around of men, and working forces will be more or less disorganized for some time, thus restricting production. One observer estimates that even if the strike now wanes rapidly it will be six months from now before working forces are as efficient and well balanced as before the strike.

Gains in Output

In Western Pennsylvania employment has increased somewhat in the week. Except for a few plants there are approximately as many men as needed but taking the region as a whole production is 10 to 15 per cent. under normal. The greatest improvement at any one point has been in the case of the Lackawanna Steel Company, in the Buffalo district, whose works were completely closed at the beginning of the strike, but which are now showing a moderately fair operation. The tonnage is not altogether in proportion to the number of men in employment, but is increasing. Other works in the Buffalo district that were affected by the strike are doing better.

The Mahoning Valley in Ohio, which comprises about 10 per cent. of the country's steel making capacity, was closed tight within the first two days of the strike. It is expected that whenever operations should be resumed in the valley, and particularly at Youngstown, the principal point, the resumption would occur through there being a general break in the strike. That, however, has not been the course. Three weeks ago one blast furnace in Youngstown resumed, but even now only a small percentage of the capacity of the valley is in operation. It is understood that in many cases the men at work are living inside the mills.

The Wheeling district remains closed tight, except for a few sheet and tin mills in Wheeling that have operated right along, and two or three plants on the outskirts of the district. It is the common belief that it is at Wheeling that the strike will hang on the longest, the district being famous for strikes and labor troubles generally. Reports from Gary and Chicago are that operations are heavier in that district, though it is very doubtful whether production there approaches 50 per cent. of normal. The whole South continues to operate normally, as does Eastern Pennsylvania.

Steel Price Prospects

If the law of supply and demand were allowed free play it would send steel prices up. Steel was by no means plentiful before the strike, yet the mills were making approximately as much as they could, their output being between 85 and 90 per cent. of capacity, and at the rate of about 2,500,000 gross tons of finished rolled steel a month. The deficiency in output in the first month of the strike was between 1,000,000 and 1,250,000 tons, and the second month, now entered upon, promises to witness loss of by far the better part of a million tons, so that even if the strike should now recede rapidly there is indicated a deficiency of at least 2,500,000 tons, or a whole month's production, since after the men are all back at work production will not at once jump to normal. Before the strike steel prices were strong, and they are low rather high compared with commodity prices in general. The March 21 steel prices, which have remained since then as the quotable market, are 81 per cent. above the ten-year pre-war average of steel prices. The Dun and Bradstreet index numbers, of commodities in general, have advanced since March 21, and now stand at 112 per cent. and 128 per cent. respectively above their corresponding pre-war averages. Demand and supply would point to higher steel prices, and relationship

of steel to other commodities would point the same way.

From the present outlook, however, the prospect is that basis steel prices will not advance. While no formal announcement has been made, there is much reason for believing that the United States Steel Corporation is strongly opposed to there being any price advances, either during or for some time after the strike, and some of the large independents may line up on that side. The smaller mills, those that do not sell far ahead, would undoubtedly charge all they could get, and that would mean premiums on early deliveries, with prices unchanged for delivery at mill convenience.

All the indications are that demand for steel will be heavy for a long time to come. The cost of making steel is not likely to decrease materially, and is much more likely to increase. When the strike is all over the mills will consider the matter of adopting the eight-hour shift as against the present twelve-hour shift, and its adoption will probably hinge largely upon the question of its being possible to obtain the additional men needed. If that is done men will receive less pay per day but higher pay per hour and thus the wage cost of making steel will increase. With values of commodities generally so much higher, relatively, than steel prices, it is not entirely improbable that in the long run steel prices will advance. Some time in the future there will be panic and industrial depression, with men hunting jobs instead of shirking work, but practically everyone expects that time to be several years in the future, leaving time for various fluctuations to occur meanwhile.

Pig iron is strong and advancing, largely in line with its strong tone before the strike, rather than because of the strike. While the strike has closed a few merchant furnaces it has also decreased the quantity of merchant pig iron used directly or indirectly by the steel works, so that advances in pig iron are not to be ascribed wholly, or perhaps even largely, to the strike. The lake front furnaces at Chicago, Cleveland and Buffalo have been greatly affected by the strike, but few furnaces elsewhere are idle from strike.

MONTREAL NOTES

The St. Lawrence Welding Works of Montreal are going in for the manufacture of steel tanks. They will acquire a new plant for this purpose.

The Modern Tool Company, of 1495 Notre Dame Street East, are going into the manufacture of one-ton trucks for industrial and warehouse purposes.

The Canadian Kron Scale Company, of 16 Notre Dame Street East, Montreal, has acquired a local plant where they will manufacture the Kron scales for the Canadian trade. This company has also taken over the selling agency for Eastern Canada of the Brantford computing scales. The Kron scales are almost exclusively used in manufacturing plants, warehouses and factories, while the Brantford line is more suitably adapted to the retail trade. The Kron Scale Company has likewise secured the Canadian manufacturing and selling rights for the Stuebing Truck Co. of Cincinnati, Ohio. G. H. Smith is the Canadian secretary.

Chas. Crawford, of Crawford and Co., chain manufacturers of Walsall, England, has been in Canada during the past week or so, visiting Montreal and Toronto, with the object of studying the field with a view of developing trade in this country.

It is announced that the Dominion Steel Corporation will shortly undertake the development of new submarine coal areas on the north side of Sydney Harbor, the headquarters of the mine to be at Bonar Point. The work is part of the plan necessary to supply a high grade metallurgical coal that will be required to manufacture the steel produced at the new steel plate mill, and also contemplate shipbuilding developments. The necessary equipment will involve an approximate expenditure of $2,000,000.

The arrival of ten captured German guns was a feature of last week's activity at the harbor, but the event was known to few beside the officers in charge of the vessel and the guns. The guns were those taken by Montreal units, and will be drawn through the streets during the Victory parade in honor of the Prince.

At last week's meeting of the Engineering Institute of Canada, a paper entitled "Grain Dust Explosions; Their Cause and Prevention," was read by J. A. Jamieson, M.E.I.C., M.A., Soc. C.E., who was the designer of the Port Colborne elevator, which was the scene of a serious explosion some time ago. In the opinion of the speaker, the cause of the accident was the choking of one of the lofters. The author of the paper went into the matter very thoroughly and discussed the technical points involved in the cause of dust explosions. A discussion of this paper will be conducted at this week's meeting of the society.

Mr. J. F. Paige, general manager of the Port Arthur Shipbuilding Company, is leaving there shortly to take charge of the Halifax Shipyards. Mr. Paige has had a very broad experience in the shipbuilding and marine engineering fields. He was formerly with the Fore River Shipbuilding Company, and while with them visited Japan and Italy in their interests, looking after the turbine installations in Japanese and Italian warships. Mr. Paige is a Canadian, having been born in Nova Scotia, in which province he served his apprenticeship. He also sailed as engineer for some years in the Dominion Atlantic Railway Company's ships.

AUTUMN MEETING OF ELECTRICAL ENG.

Review of Work Undertaken at the Ottawa Conference—Papers Are Read

The first autumn meeting of the Toronto Section, the American Institute of Electrical Engineers, was held in the Engineers' Club, Friday, October 24. A review of the work accomplished by the National Industrial Conference held at Ottawa was presented by Mr. Frank R. Ewart, representative of the institute. The appointment of engineering delegates representing the various societies was a recognition of the engineer's status as one who, while coming into intimate contact with both the manufacturer and laborer, yet was in a position where impartial judgment and knowledge might be expected. One of the most noticeable things about the proceedings of the conference was the complete and accurate information of the labor delegates. When one of them spoke, no time was wasted in preliminary remarks, but the whole time available to the speaker was made use of in the presenting of information vital to the cause of labor. The briefs presented by those representing the manufacturing element of the community in some cases were not so well prepared, nor did they show such a familiarity with statistics and other information pertinent to labor. Mr. Ewart's further remarks had to do with the various topics of the agenda and the manner in which they were treated. In the discussion which followed, Wills McLachlan emphasized the importance of the necessity for thorough knowledge of economics on the part of both manufacturer and engineer. Both should be as familiar with the subject as was the laboring element of the community.

An interesting paper on water-turbine design was read by Mr. Adolph Eberli, hydraulic engineer, the Hydro Power Electric Commission of Ontario. Information regarding the design of this prime mover was given, and in the paper itself and in the discussion which followed, interesting facts regarding present-day developments were brought out. The Francis turbine, which is used almost universally up to high heads, is only a development, so far as its present design is concerned, of the past twenty odd years. It was formerly thought only suitable for moderate heads, but is now used everywhere, except where exceptionally high heads are encountered, as in mountainous districts. The turbines being built for the Chippewa-Queenston development are of this type.

The Black & Decker Mfg. Co., Baltimore, Md., have recently issued a very attractive and interesting catalogue on electric air compressors, portable electric drills, and electric valve grinders. Those interested in these lines can secure a copy by application to the above mentioned concern.

No. 4—Inclinable Open Back Press.

Consolidated Presses

represent the highest grade in quality of material, design and workmanship, and have many exclusive features which make for economy in operation, notably the three locking points in the hubs of all flywheels, giving 20 per cent. more production than any press having only two locking points in flywheel to engage clutch.

PRESSES FOR MARKING FUSES, FOR FUSE BODIES, FOR BLANKING, CUPPING AND DRAWING CARTRIDGE CASES.

Also a general line of Punch and Inclinable Presses.

Manufactured by

The Consolidated Press Co.
HASTINGS, MICH.

GEOMETRIC

Adjustable Collapsing Taps

Have overcome all the expense and annoyance of tapping screw threads with a solid tap.

Anyone doing thread tapping knows what backing out a solid tap each time means. It usually means low production, poor threads, and worn out taps.

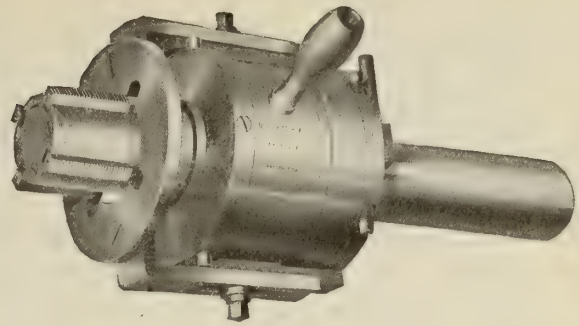
The mechanism of the Geometric Taps takes care of adjustment to correct diameter each time a thread is tapped, it collapses the chasers automatically, leaving a thread clean cut and perfect.

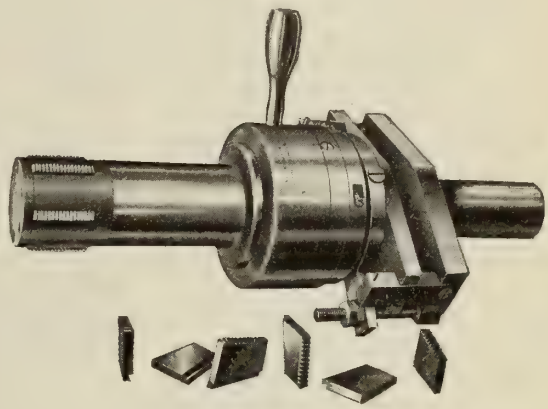
The chasers are readily reground, and when finally used up, are renewed at comparatively small cost, leaving the tap as efficient as when new.

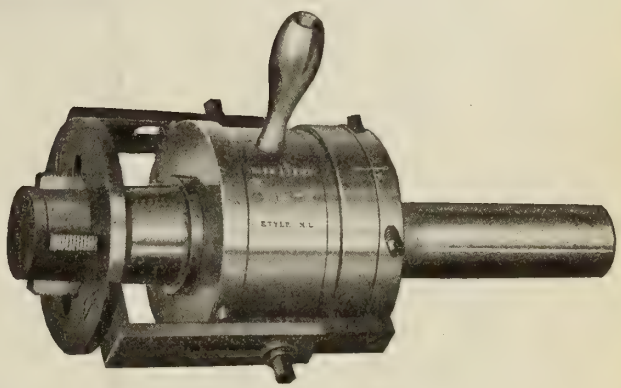
The manufacturers of the Geometric line of Collapsing Taps and Self-opening Die Heads are justly proud of the distinction which is theirs:—

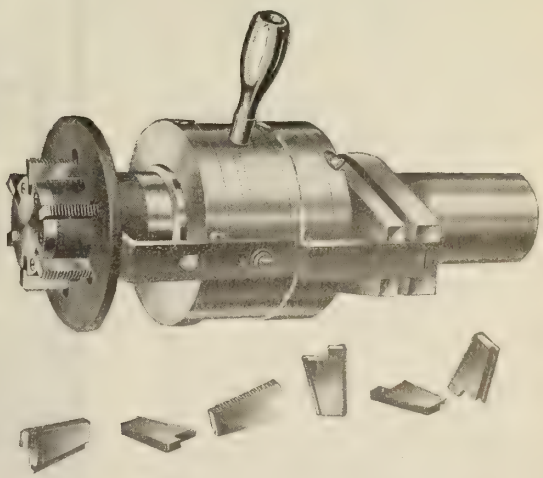
The Originators
and the
Largest and Best Known Manufacturers
of
Automatic Threading Tools

For cutting all classes of screw threads, internal and external, of any diameter and form.









The Geometric Tool Company

RATIONS SERVED IN OLD COUNTRY

Railroad Strike, as Experienced by Former Member of CANADIAN MACHINERY Editorial Staff

A. G. Webster, formerly on the staff of CANADIAN MACHINERY, writing to this paper from Sheffield, on October 1, says:

"The threatened railway strike has become an accomplished fact, and the whole country is tied up. Conditions in Great Britain were never, perhaps, in such a chaotic state as at the present time. The strike of railway employees, including locomotive engineers and firemen, following the iron moulders' strike, has tied up the engineering industry. A few trains are running, but it has been necessary to organize motor transports to feed the population and carry mails, while motor bus services for passenger traffic have been organized by private enterprise. In this way the business of the country is being carried on. The situation is particularly serious owing to the fact that increased production is so vitally necessary for the welfare of the country, and under prevailing conditions business is almost at a standstill.

"I have heard nothing lately in regard to Canadian business in England, and less seems to have been written about American material being delivered here. The strike, however, will probably cause considerable business to leave the country. Readjustment is proceeding very slowly, and unsettled conditions will prevail for some time to come. I suppose it is a natural result of the upheaval caused by the war and is world-wide. This week we are being rationed on a war basis, 2 ounces of margarine, 30 cents' worth of meat, 2 ounces of sugar, and so on per week per head.

"I have not yet been able to secure a berth on a steamer but believe the situation is becoming easier as more troops are shipped back.

"The Government have a peculiar way of annexing a considerable portion of one's salary, and the high cost of living attends to the balance. There is thus every inducement for people to leave the country, and I believe a large number are doing so, or at least as many as can get passage."

DEEPEST WELL IN THE WORLD

The "Mining and Scientific Press" tells us that the deepest well in the world, already 7,363 feet deep, is now being drilled on the Goff farm, eight miles northeast of Clarksburg, W. Va. The drilling is still in progress, and sufficient length of cable and adequate power and tools are at hand for driving still farther into the crust of the earth. The well goes frther down than the deepest mines in Michigan, Brazil, or Europe. Several oil wells in California, in the Southwest, in West Virginia, and in Pennsylvania have exceeded 4,000 feet in depth, and one near MacDonald, Pennsylvania, fourteen miles west of Pittsburgh, reached 7,248 feet below the surface. The temperature at a depth of 7,000 feet was found to be 152° F., and the rate of increase at this depth is about 1° in every 51 feet. It is estimated that the temperature of the rocks beneath the Goff well will be found at the boiling point, 212° Fahr., at a depth somewhere around 10,000 feet. The well is being drilled in search of deeper oil-sands than have been reached in this part of the basin. If the well strikes a valuable oil or gas pool, it may lead to the development of new reserves that may open up a new era in the history of the Appalachian oil and gas region.

What is said to be a record in steel production has been made by a steel mill in Lanarkshire, Scotland. Working at a cold charge capacity of 45 tons the mill produced in one week 21 charges, totalling 980 tons. The product was made into plates, rails and angles. The highest output with similar furnaces in the United States is 600 tons. The U. S. must look to its laurels.

Apropos of the League of Nations, and the universal peace which is so confidently expected by some, it is interesting to learn that Vickers, Ltd., the great English firm of shipbuilders and armament manufacturers, are shortly making new affiliations. It is said that they are about to form a partnership with the Creusot firm, with a view to establishing a Polish firm at Warsaw, to be devoted to the production of war materials. Evidently this firm at least has little faith in the dawn of the millennium.

Sir Joseph Davies, K.B.E., the well-known South Wales financier, speaking at the annual meeting of Messrs. J. Samuel White & Co., Ltd., made an interesting remark. He had just returned from a visit to the United States, where he had inspected the largest yard, including that at Hog Island. His impressions were summed up in the following manner: "I should like to mention one thing in regard to America, where I have had the opportunity of seeing the new and old yards. I have come back satisfied that we can always hold our own in shipbuilding unless a great change is brought about on the other side."

Consolidated Smelters Move to Montreal.—The head office of the Consolidated Mining and Smelting Company will in future be located at 511 St. Catherine Street W., in the Drummond Building, Montreal. The Ontario sales office will still be kept on in the C. P. R. Building, Toronto. The company have added two new mines to their list of shipping mines recently, the Stemwinder at Greenwood and the Mountain Chief at Renata.

IS THERE ROOM FOR ME?

INDUSTRIAL NEWS

NEW SHOPS, TENDERS AND CONTRACTS PERSONAL AND TRADE NOTES

TRADE GOSSIP

St. Thomas Gets Plant.—It is rumored that Dodge Bros., Limited, have decided on locating a plant in St. Thomas for the manufacture of automobiles.

New Toronto Firm.—The incorporation is announced of the Canadian John Wood Company, Ltd., with head office in Toronto, and a capitalization of $200,000.

Brantford's Good Business.—A leading Brantford industrial magnate made the statement recently that every big factory in Brantford had orders on hand to keep them working at full capacity for a considerable time to come.

Wants Machinery.—The St. Lawrence Welding Co., 138 Inspector St., Montreal, want a second-hand power punch and shear to work half-inch plate; also a set of power rolls, 10 ft. to 12 ft. long, to roll ½-in. plate.

Electrification at Dominion Coal.—The Dominion Coal Company at Glace Bay are planning to utilize all their exhaust steam to drive low pressure turbines, in turn driving generators, to supply all the power at the new mines, and future developments.

Exporting Steel Products.—The growth of the Armstrong, Whitworth plant at Longueuil, Quebec, near Montreal, is shown by the fact that not only are they supplying the Canadian market with steel tyres for locomotives, but are exporting their product to Australia.

Mines Kept Idle.—Through a shortage of cars on the Canadian National Railway the coal mines at Wayne, Rosedale and Drumheller were idle for two days. There are no domestic coal stocks on hand in Alberta, and interruption to the shipments will be attended with serious results.

School By-law Passes.—A by-law submitted to the ratepayers of Ingersoll for a new central school to be built at a cost of $120,000, was passed by a majority of 395. A similar by-law presented four years ago was defeated, and the board made preparation of this one by wide advertising and a vigorous campaign.

To Assist Loans.—In connection with the Victory Loan in Ingersoll, the local factory employees have been organized to render assistance in the campaign. After listening to addresses from the organizers, men in ten different factories were selected to handle the work for their own industry. A successful campaign is anticipated.

West Wants Factories.—Mr. T. A. Russell, president of the Toronto Exhibition, has just returned from a trip West. He says that the people of the West are anxious to have branch factories established in their provinces. They seemed as reluctant to send their money east to manufacturers there as we are to send ours to the States.

STEEL TIRES ARE MADE IN CANADA

Error Made in Announcing New Industry—Armstrong Whitworth Making And Exporting as Well

In connection with the announcement in last week's CANADIAN MACHINERY of a new industrial enterprise for the manufacture of steel tires, it was stated that this was a new industry in Canada, these tires having, until now, to be imported. This was inaccurate, as the Armstrong-Whitworth of Canada, Limited, have a large plant where this work is done at Longueuil, Que. For the past eighteen months this company has been manufacturing locomotive and car wheel tires at that point, and tires of their make are from steel of their own manufacturing, and the various processes, such as forging, rolling, finishing, etc., are completed in their shops. They have supplied tires to practically every railroad in Canada with the greatest success both as to quality and workmanship, and have also shipped tires to such countries as the Dutch East Indies, Australia, South America, etc. CANADIAN MACHINERY regrets the mention of the fact that tires had to be imported, as the Armstrong-Whitworth Co. have a very large and capable organization turning out a superior product.

New Terminal Company. — The Havana Marine Terminals, Limited, has been incorporated at Ottawa with a capital of $30,000,000, and headquarters at Montreal. The company has a very wide charter, including the building of graving docks and acquiring of steam and sailing ships. Gordon McDougall, K.C., is among the provisional directors.

Brantford Factories Prepared. —The various factories in Brantford are not worrying over the prospect of a coal strike on November 1st in the soft coal mines of the United States. Nearly all of them have a stock of coal to last them over six months, and the schools and waterworks are likewise well supplied.

New Industry in Hamilton.—After negotiations stretching over a period of one and a half years, the British-American Oil Company have decided to erect an oil refining plant in Hamilton. The news was announced by Industrial Commissioner Kirkpatrick, who stated that the plant would mean an investment of $100,000 and would be located near the Oliver Chilled Plow Works.

Nova Scotia Miners' Demands.—The miners in Nova Scotia have been holding meetings to determine their attitude towards wage increases. While nothing definite has been settled the feeling is that there should be a revision upwards. It is expected that the men will wait and see what action is taken by the American mine workers, and follow it up with similar action on their part.

Fuel Commissioner's Warning.—Mr. H. A. Harrington, Deputy Fuel Commissioner of Ontario, has made a statement that the coal situation throughout the province requires careful handling. He calls attention to the following order: "Anthracite coal of what is known as prepared sizes shall not be used by any industrial consumer for heating or power purposes except with the written consent of the Fuel Commissioner.

Telegraph Rates To Go Up.—The Board of Railway Commissioners are to hold a series of sittings over Canada to obtain the views of the public on the application of the telegraph companies for an increase of practically 20 per cent. on the present telegraphic rates. Sittings will be held in Ottawa on Nov. 11 and 12; Winnipeg, Nov. 15, 17 and 18; Vancouver on Nov. 22 and 24; and Victoria on the 25th November.

To Handle Grain.—There will be ship capacity to the amount of 15,000,000 bushels required to handle the grain at the head of Lake Superior for late loading. A large part of this grain will have to be stored in ships in Canadian ports, being too late for shipment down the lakes. It is probable that a number of American ships will be used to handle the grain, under the rates of the present agreement with the United States Food Administration.

Toronto Firm Reorganized.—Kerr Bros. File Works, Toronto, a long established concern, has been taken over by new interests and will in future be known as The Kerr File and Tool Company, Limited, head office at 39 Richmond Street East. A new and large building is under construction. They will be in a position to greatly increase the production of their files. For the present files only will be manufactured, but it is possible that small tool manufacturing will be started at a later date.

Machinery Wanted.—A new firm locating in Canada have asked the Chapman Ball Bearing Co., 347 Sorauren Ave., Toronto, to put them in touch with firms who are in a position to supply the following equipment:

1 No. 0 Brown and Sharpe Plain Milling Machine.

1 No. 2 Brown and Sharpe Plain Milling Machine.

10 No. 00 Brown and Sharpe Automatic Screw Machines.

4 No. 0 Brown and Sharpe Automatic Screw Machines.

5 No. 2 Brown and Sharpe Automatic Screw Machines.

Patents Issued:—The following is a list of Canadian patents recently issued through the agency of Messrs. Ridout & Maybee, 156 Yonge Street, Toronto, from whom further particulars may be obtained: John L. H. Blackwood, button stick; Edward B. Killen, vehicle spring suspensions; Gutta Percha & Rubber, Limited, rubber mat; Fred L. Rapson, lifting jacks and the like for use on motor, road, and other vehicles; Woodington & Young, abrasive wheel; Huan A. Matear, internal spring heel seats; J. Stone & Co., Limited, valves for fluid pressure systems for operating bulkhead and like doors; Farm & Dairy Machinery Co., pneumatic valve actuating devices; Edward Manser, acid still.

Extending Plant.—Armstrong Bros. Tool Co., of Chicago, are making extensive additions to their plant, buildings and equipment. The new buildings include an addition to the Drop Forge department, a new building for the hardening and heat treating department, and a new reinforced concrete building for the general office, finished stock and shipping department. Building operations, which were tied up for several months by strikes, are being rushed to completion. The new buildings and equipment, together with the re-arrangement of the entire plant made possible thereby, will largely increase the company's production, an increase urgently needed to take care of its rapidly growing business.

TENDERS

The Deputy Minister of Provincial Highways is calling for tenders which must be in by November 5 for the clearing, grubbing, and all necessary work for the construction of the provincial highway in the vicinity of Ancaster. Plans and specifications will be available after October 27 at the office of the Resident Engineer, Paris, Ont.; the City Engineer, Hamilton, and the Deputy Minister, Parliament Buildings, Toronto.

INCORPORATIONS

The Central Electric Supply Company, Limited, has been incorporated under the Ontario Act, with a capital of $150,000 in 1,500 shares of $100 each. The head office will be in Toronto and the business of the company to deal in and instal electric apparatus and fixtures.

The Canadian Mexican Oil Company, Limited, has been increased under the Ontario Act with a capital of $1,000,000, divided into one million shares of $1 each. The head office will be in Toronto, and the company will carry on business as miners, explorers, etc.

The Ontario Tie Timber & Construction Company, Limited, has been incorporated under the Ontario Act with capital of $350,000, divided into 3,500 shares of $100 each. The head office to be in the town of North Bay and the company's business to deal in lumber, and carry on a general contracting business.

The E. A. Lowry Power Equipment Company, Limited, has been incorporated under the Ontario Act with a capital of $50,000 divided into 500 shares of $100 each. The head office will be in the city of Guelph, and the business of the company to manufacture and sell all kinds of power plant equipment.

The J. K. Carroll Construction Company, Limited, has been incorporated under a provincial charter in Ontario, with a capital of $40,000, divided into 400 shares of $100 each. The head office of the company will be in Kingston. The object of the company will be to deal in real estate, building operations, etc.

The T. M. Partridge Lumber Company, Limited, has been incorporated under the Ontario Companies' Act with a capital of $100,000, divided into one thousand shares of $100 each. The head office will be in the town of Rainy River. The company will carry on a general lumbering business.

The Canadian Oliver Chilled Plow Works, Limited, a company incorporated under the Federal Law, has been granted a license by the Ontario Government to carry on its business in Ontario, under the act respecting the licensing of extra provincial corporations. The company must not use a capital of more than $20,000 in its Ontario business.

Other incorporations are as follows: —Farmers' Mining Company, Ltd.; Riverdale Garage, Ltd.; The Mississippi Golf Club, Ltd.; Elgin Milk Products Company, Ltd.; Food Shops, Ltd.; Allen's Russel Theatre, Ltd.; Crookston Quarries, Ltd.; Weston Flour Mills, Ltd.; K. & S. Tire & Rubber Co., Ltd.; Northern Ontario's Great Mines Development Co., Ltd. (no personal liability); Hollinger Stores, Ltd.; The Fort William Arena Company, Ltd.; John D. Ivey Co., Ltd.; McLennan's, Limited; The Guelph Arena Co., Ltd.; The Bluffs Shooting & Fishing Club; Durham Securities, Ltd.; Glendale Realty, Ltd.; Cadogan Investments, Ltd.; Skead Gold Mines, Ltd. (no personal liability); The Verral Storage Company, Limited.

MARINE

Shipbuilding Returns.—Lloyd's Register of Shipping gives the vessels under construction at the end of September as 5,230,000 outside of the United Kingdom, and 2,800,000 tons in the U. K. Of the vessels being built abroad, 2,584,000 tons are under Lloyd's classification.

New Steamship Services.—New services are being inaugurated by the Canadian Government Merchant Marine and private lines. These include services between Buenos Ayres and Monte Video and Canada, and also a service from Vancouver to the Mediterranean and Black Sea ports. These new lines will make their initial sailings in October.

Halifax.—Mr. Harry T. Sailor, of New York, has purchased the new four-masted schooner "Breakers," built in Yarmouth for the American Balso Company. She will be renamed the "Balso" and placed under the United States flag. Capt. Dixon, late of the United States Shipping Board, has assumed command.

Bridgeburg.—The crew of the ferry steamer "Orleans," owned by the International Ferry Company, quit work without any notice. They wanted an increase of pay, but the captain claims that they did not ask for it, but just quit. After some hours a new crew was shipped at the same rate of pay, and the old crew have started work at the shipyard.

Ottawa.—By a recent act passed by the Parliament of Great Britain, all vessels sailing from a U. K. port, under the British flag, must carry a wireless installation, and wireless operators. This will apply whether the vessel is registered in Great Britain or one of the Dominions, if the vessel is of 1,000 gross tons or over. The act will come into force three months after the expiration of the Defence of the Realm Act, by the declaration of peace.

Montreal.—The "War Raccoon" has arrived down from Toronto and will go into the dry-dock of the Canadian Vickers Co. before loading a cargo of lumber. She was built for the Imperial Munitions Board and is owned by Tyzack & Brantfoot, Newcastle-on-Tyne. Another new vessel in the port is the "New Toronto," built for the Elder, Dempster Line by Harland & Wolff for the Canada-South African service. She will sail about November 5.

Ocean Service Improving.—According to Mr. A. G. Henderson of Glasgow, director of the Cunard and Anchor Steamship Lines, a great improvement would soon be noted in ocean services. Both the lines he was interested in were building new steamers rapidly, and these vessels were more commodious than their predecessors. In about one year to a year and a half the services between Canada and Great Britain and Europe would be equal, and may be superior to those of the pre-war period.

A Little Act of Courtesy That is Good Business

BY simply mentioning CANADIAN MACHINERY when writing to our advertisers you will be doing something which will prove of three-fold benefit.

First—It will benefit you because it enables the advertiser to immediately associate your enquiry with the product advertised, resulting frequently in quicker service.

Second—It will benefit the advertiser because it enables him to identify and classify enquiries and to give credit where credit is due.

Third—It will benefit **your** paper because in the records of the advertiser it will receive the credit for your enquiry, instead, perhaps, of some less deserving medium.

We are always grateful for favors of this kind. It costs the reader nothing, and yet as we said before, it is of three-fold benefit.

Ottawa.—An amendment will be made to the Canada Shipping Act, enabling any Canadian registered vessel exemption from pilotage in certain waters. The amendment applies to vessels trading between British Columbia ports and San Francisco, or ports north of the latter.

PERSONALS

The vacant treasurership of the Engineering Institute of Canada has been filled by the appointment of Sir Alexander Bertram to the office. He succeeds the late Ernest Marceau.

Mr. L. R. Brown has been appointed road engineer with the Dominion Tar & Chemical Company. Mr. Brown was formerly engineer and superintendent of the Toronto Chemical Company, Sault Ste. Marie.

W. C. J. Hocken, of the Chapman Double Ball Bearing Co., has just returned from Winnipeg, and has placed orders in Winnipeg city for the Western trade for roller bearings for Ford and Chevrolet axles, amounting to $20,000.

Mr. R. A. Ross has been elected to the presidency of the Engineering Institute of Canada for the year 1920. Mr. Ross is City Commissioner of Montreal and chairman of the Lignite Utilization Board of Canada. Mr. Ross, who formerly had a large private practice as a consulting civil and electrical engineer, has been city commissioner for about a year and a half.

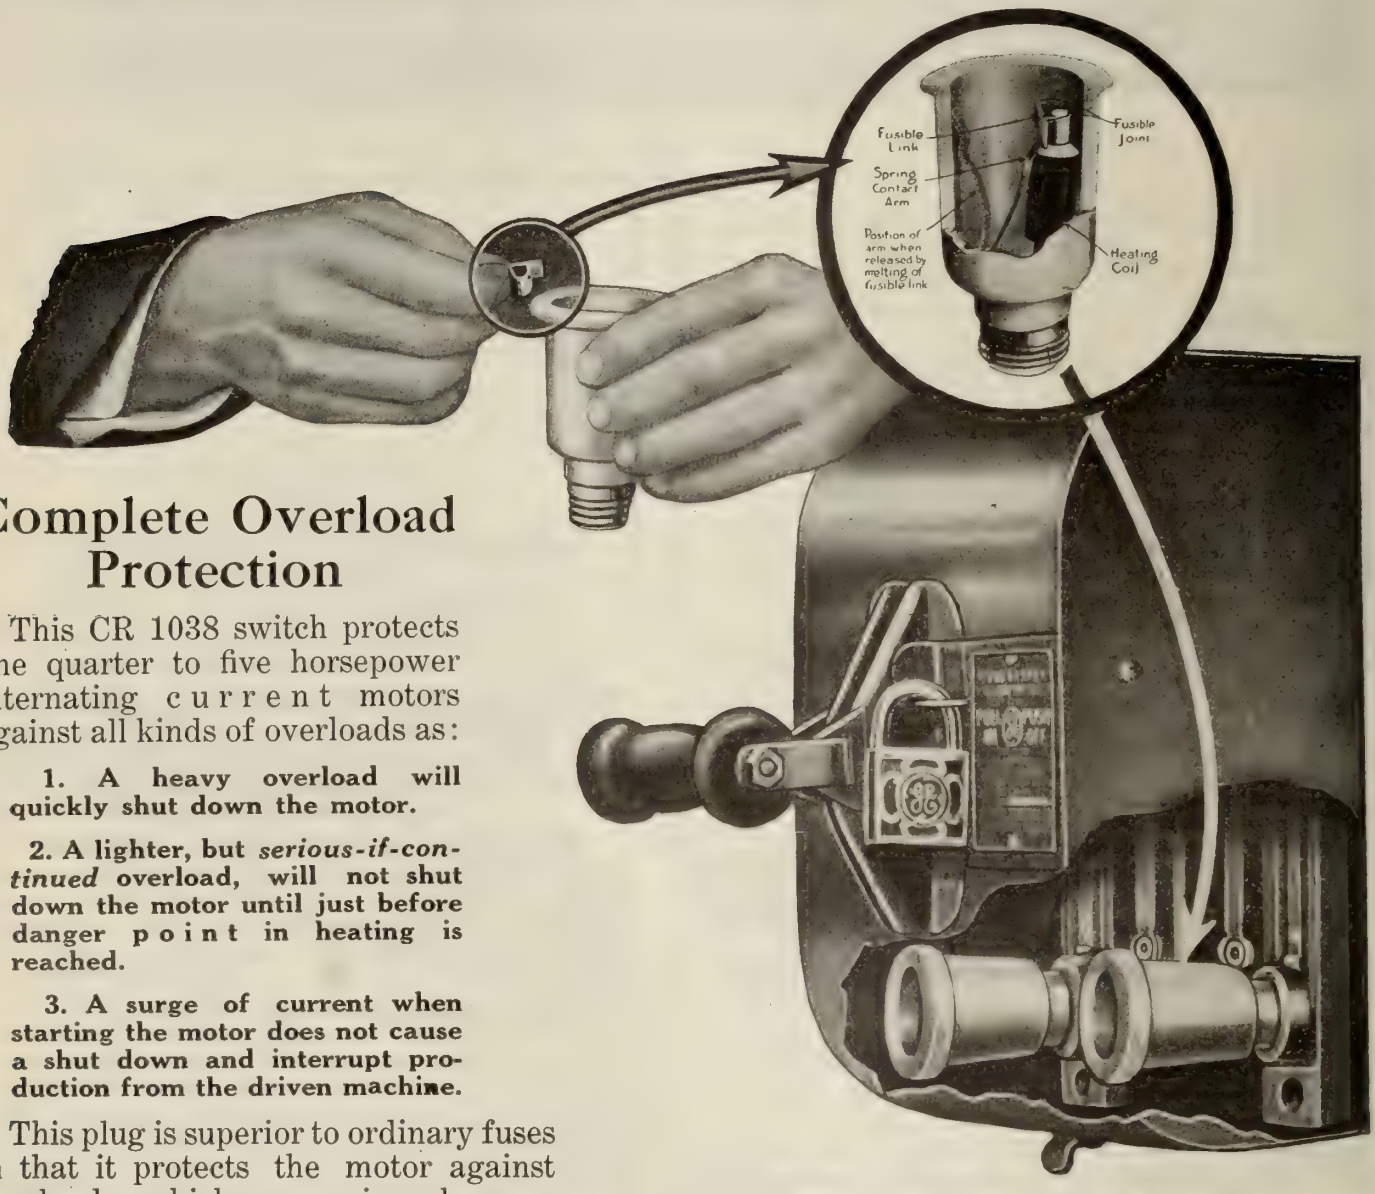
Important motor driven productive machinery must be kept going. Interruptions are practically eliminated where motors are automatically protected against only the overloads that injure.



Complete Overload Protection

This CR 1038 switch protects one quarter to five horsepower alternating current motors against all kinds of overloads as:

1. A heavy overload will quickly shut down the motor.

2. A lighter, but *serious-if-continued* overload, will not shut down the motor until just before danger point in heating is reached.

3. A surge of current when starting the motor does not cause a shut down and interrupt production from the driven machine.

This plug is superior to ordinary fuses in that it protects the motor against overloads, which are serious because continued, while the former protected only against peak overloads.

Ask our nearest office for descriptive sheet No. 68327A

A small spring switch in the porcelain protective plug shown is held shut by slipping a little link over its end. If a current large enough to injure the motor flows through the plug the fusible joint of the link is melted by the heating coil. For the cost of a postage stamp the link can be renewed and plug made operative again.

A CALL TO NATIONAL SERVICE

Magnificent work was done by the Manufacturers of Canada in the previous Victory Loans.

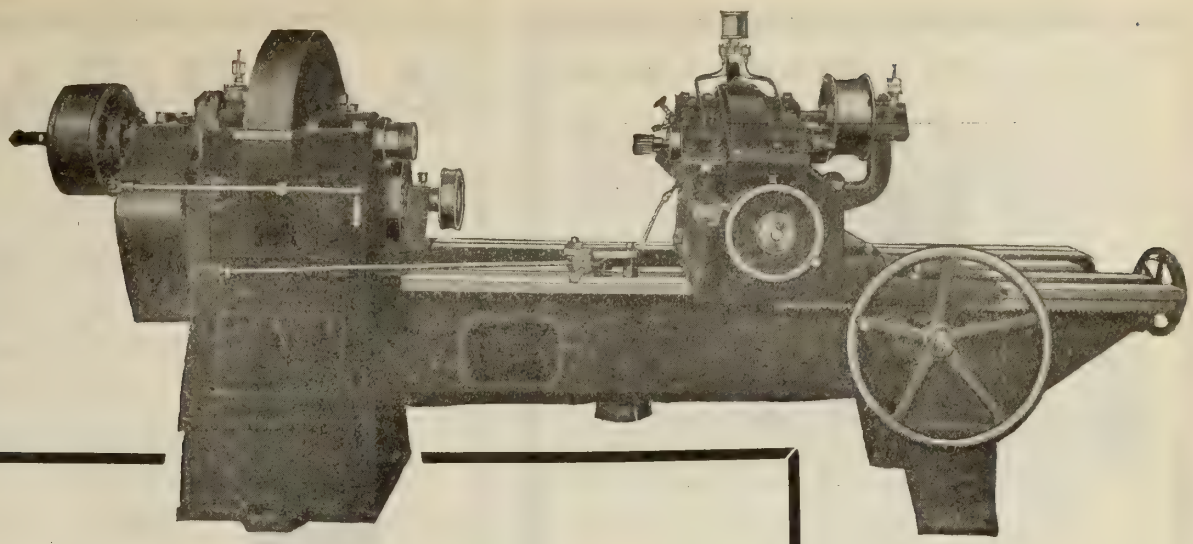
Thousands of citizens now own Victory Bonds because of your advice and help.

The Manufacturers of Canada need no lengthy arguments to prove what the Victory Loan means to industry---but your work-people may need your guidance and advice in pointing out the relation between the Victory Loan and the demand for labor.

In the past you have spread the gospel of National Service among those with whom you have great influence. Again---place your example and influence squarely behind the

VICTORY LOAN 1919

Issued by Canada's Victory Loan Committee in co-operation with the Minister of Finance of the Dominion of Canada.



No. 1

The Machine You Need —and Why!

THE simplicity of its design, the extreme care used in its manufacture and the many universal features make the **Smalley General Thread Miller No. 1** the most efficient and reliable tool of its kind.

IT IS STURDY, POWERFUL, ACCURATE AND A QUICK PRODUCER.

Mills threads with greater accuracy and speed and at a lower cost than can be obtained by any other method.

Threads are milled with one revolution of the work, and the machine is used in the manufacture of automobile parts, pipe fittings, flanges, oil and gas well supplies, in tool rooms and in all kinds of commercial work.

ISN'T THIS THE MACHINE YOU NEED TO MEET THE HIGH PRODUCTION COSTS EXISTING TO-DAY?

Let us tell you the full story of its construction and efficiency. **Write to-day.**

Oxy-Acetylene Welding and Cutting

Prest-O-Lite operator welding 6-inch nipples into steam header 14 inches in diameter.

Welded Pipe Joints Prevent Leakage

The welding of nipples into pipes, instead of using threaded fittings, is now standard practice in many plants. Welded joints are positively and permanently leak-proof, and cost less.

In repair work of all kinds, the Prest-O-Lite Process saves time and money. Repaired parts are made strong as when new, and one repair, by preventing a serious tie-up, will probably repay you the entire cost of the outfit.

Prest-O-Lite PROCESS

employs both gases (acetylene and oxygen) in portable cylinders. Prest-O-Lite Dissolved Acetylene is backed by Prest-O-Lite Service, which insures prompt exchange of full cylinders for empty ones. Provides dry, purified gas, insuring better welds, quicker work and lower operating cost.

Apparatus consists of an equal pressure blow pipe, automatic regulators and gauges, and all necessary equipment. Adaptable for oxy-acetylene cutting by the addition of special cutting blow pipe.

Thorough instructions are furnished free to every user of Prest-O-Lite Dissolved Acetylene. Any average workman who understands metals can learn the welding process quickly and easily.

We will gladly send illustrated literature and interesting data showing actual instances of savings made by others. It may suggest valuable ideas to you. Write for it.

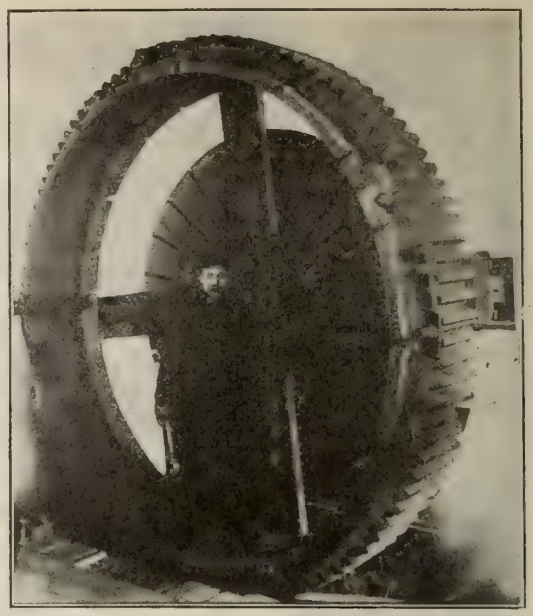
Economy A Big Factor In "HISCO" Moulded Gears



In the installation of new machinery in the working out of new processes—you may require gears or sets of gears, and no matter what the diameter, the Hisco process relieves you of the necessity of having patterns made—entailing considerable cost and delay.

"HISCO" machine moulded gears, while requiring no pattern, insure accuracy, dependability, quality, and the price is minus the cost of patterns—which in these days of high lumber and wages, and when time is a factor—is something to be considered.

The "HISCO" plant is equipped to produce machine moulded gears up to 18 feet in diameter without patterns—and remember, very often the pattern has cost more than the gears.

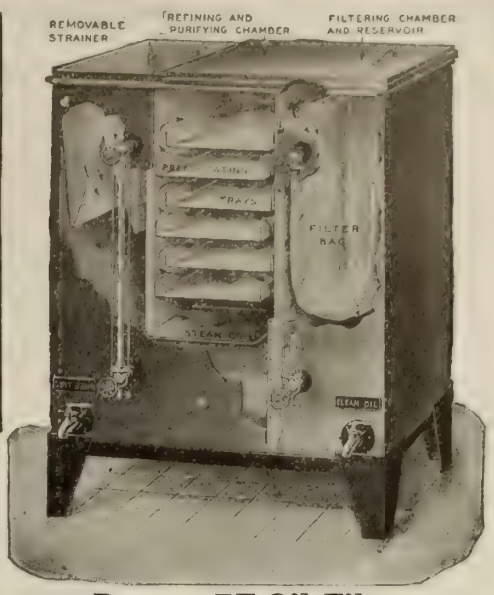
"Yes, sir, and there's a good reason for it too. Since we installed the BOWSER Oil Filtering Outfit the men in the engine room have been competing to see who could save the most oil. They've cleaned the journal boxes, put pans under them to catch the drips and then put the salvage through the BOWSER Oil Filtering Outfit. We are now using the oil over and over again that was formerly wasted."

The BOWSER Oil Filtering Outfit is simple, compact, economical and reliable.



Bowser 7F Oil Filter

First, means a cleaner engine room.

Second, it cuts your lubricating oil bill considerably.

Third, IT PAYS FOR ITSELF over and over.

"Just one blank strip after another"

This is where The Arrow Electric Company of Hartford, Conn., turns out blanks for electric light fixture parts and—makes records on "BLISS" Presses. When a strip of steel, brass, copper or pressed paper has clicked through, another follows it with the promptness of machine-gun delivery.

There are two special rules in the Arrow plant: first, rapid-fire production; second, "BLISS" Presses (over 100 of them). Like everything else in the plant these two rules work together mighty smoothly.

SWEETLAND CHUCKS

Here is another chuck from the "Sweetland" family. Our well-known "Geared Scroll Chuck" with hardened jaws ground perfectly true on face and bite. This style is also made with four jaws. We also manufacture the entire family of "Sweetlands": Independents, Universal and Combination Chucks.

Think twice on your next order; then call on "Sweetland," the old reliable.

There's a Famous Five File for Every Kind of Work

And every one is made of high grade steel, and ground and cut for its particular purpose.

Give your men Famous Five File to work with, and you will get good results.

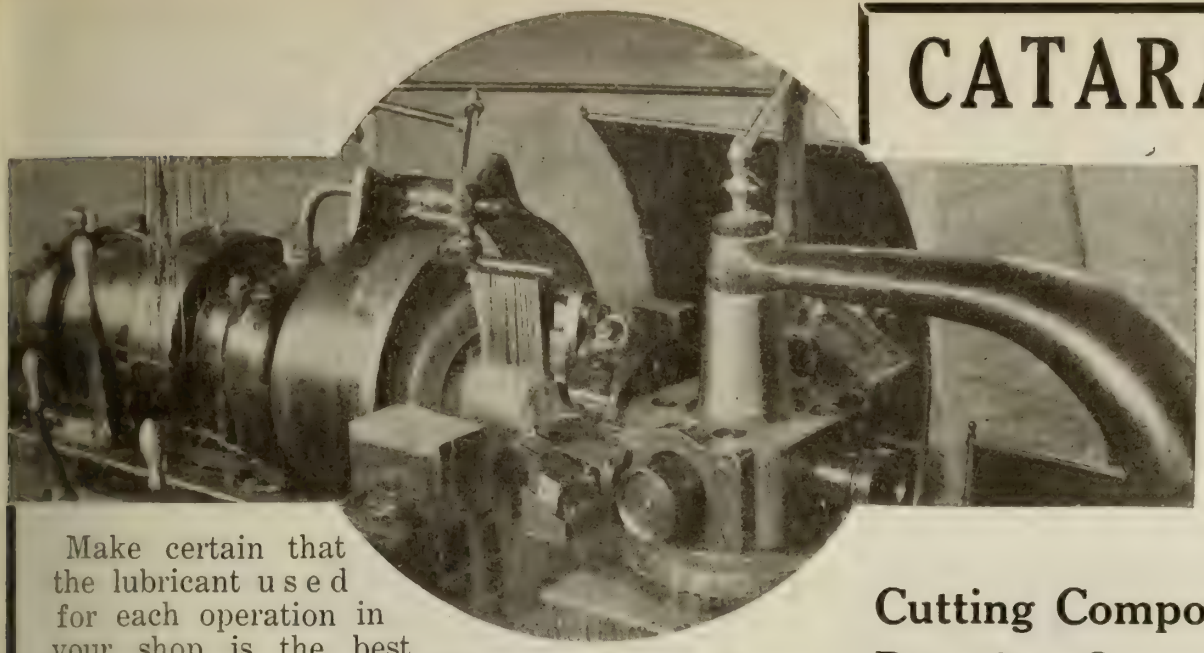
Also teach them to turn in a file as soon as it becomes dull.

You do not need to be afraid to do this with Famous Five Files because they will not grow dull quickly.

Specify them when ordering.

They are:

CATARACT



ACME

MYSTIC

SPECIAL

Make certain that the lubricant used for each operation in your shop is the best obtainable for the purpose. Otherwise your men and your tools and your machines work at a disadvantage.

Write us to-day that we may demonstrate how Cataract Lubricants can increase production and reduce cost in your plant.

Cataract Refining Company, Limited - Toronto, Ont.

Announcing—

WILLIAMS' "Vulcan" Forged-Cutter Tool Holders give unequalled service to those who prefer the solid, forged-type of cutting tool. Each Holder, by the mere insertion of small High Speed Forged-Cutters is adapted to the heaviest service on Lathe, Planer, etc.

The economy and convenience of this line, when installed as standard shop equipment, is at once apparent, as all blacksmith work, to say nothing of the very considerable investment necessitated by heavy, solid forged-tools of costly High Speed Steel, is eliminated.

Absolutely simple in construction, yet possessing all the advantages of the solid tool without its expense.

Cutters, drop-forged from the finest grade of High Speed Steel, in stock in a great variety of sizes and types, finished and hardened ready for use. Ask for descriptive booklet.

J. H. Williams & Co., 45 Richards Street, Brooklyn, N.Y.
The A. G. Low Co., Ltd., 45 Pacific Ave., Saskatoon, Sask.

MAXIMUM EFFICIENCY IN BELT LACING
A broken belt won't hold up production long if you repair it with
Patent Steel BRISTOL'S Belt Lacing
Pronounced the most efficient, because it is the easiest, the quickest and the best to apply.
No special tool is required. Simply a hammer and a soft block of wood to drive the sharp, staggered steel prongs through the belt in double rows and to clinch the points. The belt is gripped firmly without danger of cutting or weakening.
Send for samples and Catalog I-707.

Methods and Results determine Quality and Production

The cry of the modern shop is "the best work in the shortest time."

Brown & Sharpe Grinding Machines are the fundamental working basis for this rule of the shop. Much of the important work of to-day is accomplished on these machines—by results they have demonstrated their sterling qualities and high production capacity.

Their general adaptability make them appropriate for tool room use or for the manufacturing floor. The extreme accuracy that prevails where they are constructed is manifested in the final test—*in your shop*. A few moments' consideration as to their possibilities may mean hours saved in time and labor.

Send for the manufacturers' guide, Catalog 136.

Brown & Sharpe Mfg. Co.
Providence, R.I., U.S.A.

Free Tool Grinding Chart

Grind your cutting tools in exactly the right way to get best results—and you save time. That's obvious. It is precisely that that this Tool Grinding Chart enables you to do.

It has been adopted as standard by many firms that found it a long way better than guess work.

CANADIAN MACHINERY would like to see this Chart in every shop in the Dominion. Mail the coupon below for your copy to-day.

Shows at a glance Correct Clearance and Rake Angles for Cutting Tools

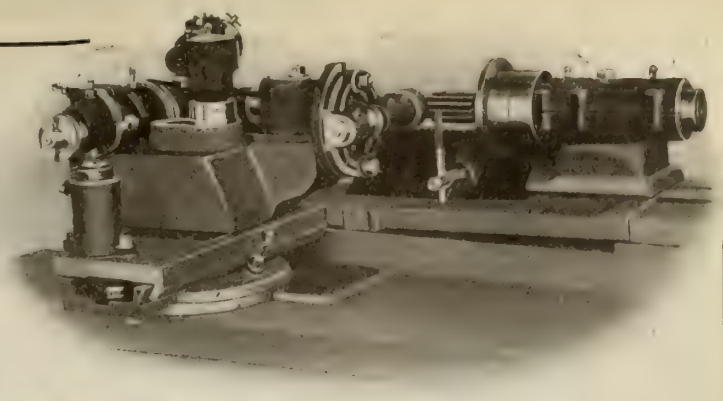
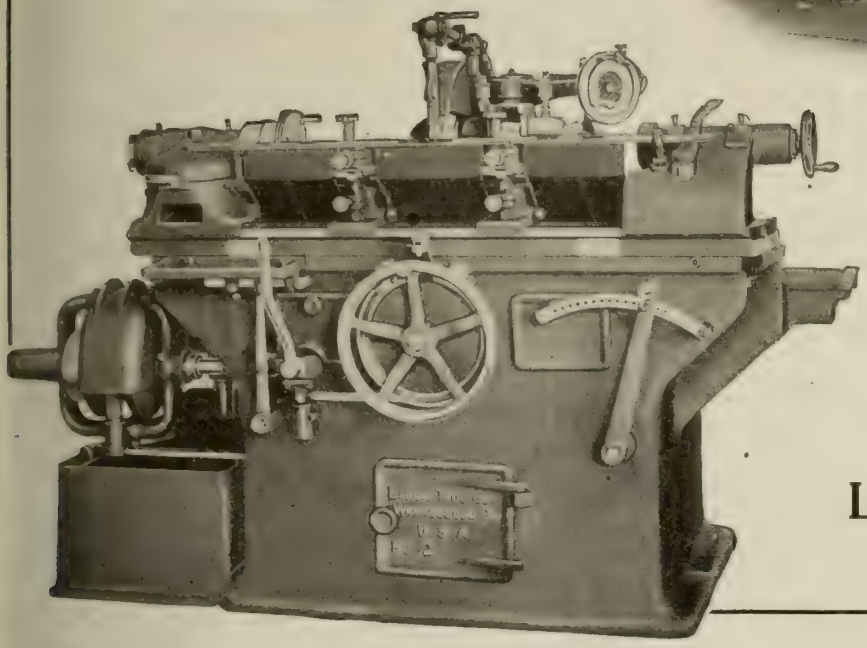
Easy to Operate

Landis Universal Grinding Machines





Backing-off Straight Reamer

Their application is practically unlimited, combining, as they do, both an external and internal grinding machine.

Besides they are economical, and increased efficiency can be obtained by the use of the magnetic chuck, side mill grinding attachment, gear cutter grinding attachment, etc. (See sketch herewith).

Landis Tool Company
Waynesboro, Pa.

LANDIS

A Plant Equipped in Every Detail to Suit Your Every Need

STEEL PRODUCTS

Open Hearth, Basic and Acid, Electric and Alloy Steels.

CASTINGS

For Ships, Railways, Rolling Mills, Gears, Machinery and Ingots to 35 tons.

RAILWAY SPECIALTIES

Penn Couplers, Bolsters, Truck Side Frames, Draft Gears.

FORGINGS AND BILLETS

Heavy Ship Forgings, Locomotive and Car Axles, Miscellaneous Forgings.

PLATES

Plates and Heavy Sheets to 30 inches wide, Soft and High Carbon, Automobile Plates and Sheets.

AGRICULTURAL STEEL

Soft Centre and Solid Plow Steel, Harrow Discs, Shovel Steel, Cultivator Blades.

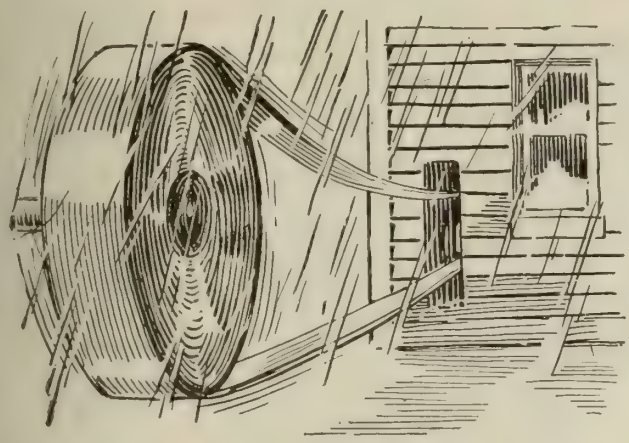
BELTING

It will surely pay you to use

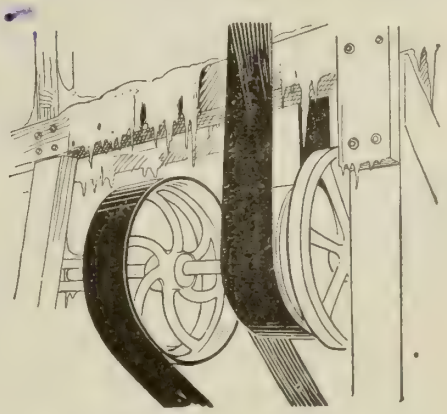
"Lanco" Balata Belting

on some of your drives

TRADE MARK LANCO BALATA BELTING



IT is a real waterproof belt and not merely waterproofed. Balata gum is applied in solution and impregnates all the fibres of the duck. Every ply of this belt is waterproof. This means that if the surface is worn off or even after a ply is worn off you still have a waterproof belt. For this reason this is the belt for wet places where you require long service.



THIS belt is good for cold places and can be used under any atmospheric conditions except those of heat. For work in wet or cold places you can buy cheaper belts that will do the work as well for a time, but would you not rather have a belt that would last longer even if you had to pay more for it?

THIS belt makes an excellent motor drive belt. It is as nearly stretchless as it is possible to make a good belt and for this reason requires very little attention. We can make it endless at our own plant and this makes it even more ideal for motor service. It will pay you well to use this belt in all places covered in the above description.

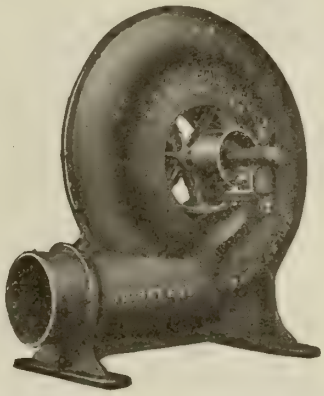
STEEL PRESSURE BLOWERS

Medium Pressure Blower



Low Pressure Blower

High Pressure Blower

For All Purposes

THO designed originally for supplying air to cupolas and forges Sturtevant steel pressure blowers are now used for all purposes where pressures up to 16 ounces to the square inch are to be maintained; and where air is to be forced for long distances. Regularly built with horizontal discharge but can be readily made for down blast or up blast. Built in all sizes and may be belt, motor, engine, or turbine driven. Operating and upkeep cost is remarkably low as proven by actual performance in many long term (30 years and more) installations. Design and construction are typically Sturtevant—supreme! Blast wheel is made of refined steel and galvanized to prevent rust. Wheels are accurately balanced and run smoothly when driven at high speed. Bearings are each cast in one piece and are lined with highly durable non-heating white metal. Write for catalogue.

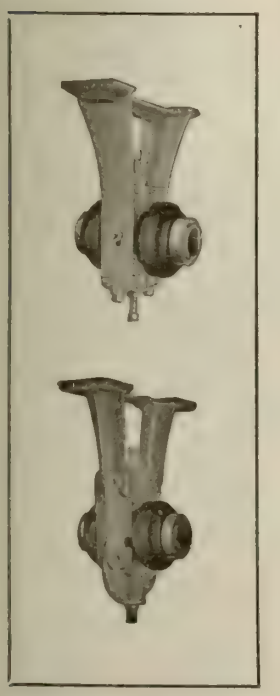
Think of It!

YOU PAY FOR THEM

Whether

YOU BUY THEM OR NOT

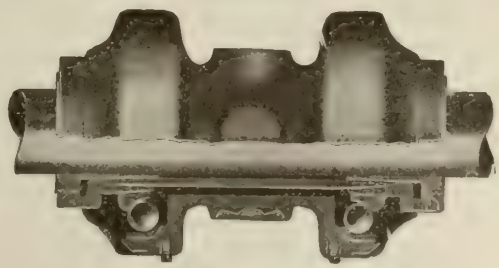


CHAPMAN DOUBLE BALL BEARINGS ON YOUR LINE SHAFTING PRODUCE THE FOLLOWING RESULTS:

15 to 40% saving of your total power cost. 95% saving lubrication.

Eliminates hot boxes and rebabbitting expenses. Are Dirt, Dust and Drip Proof.

WILL FIT YOUR PRESENT HANGER FRAMES.



Send for Catalog No. 3-B.

Butterfield

TWIST DRILLS GEAR AND MILLING CUTTERS

(Carbon and High Speed Steel)

Quality

Prompt Delivery

They're the happy result of a great combination of specially trained men and the finest special machinery—these Butterfield carbon and high-speed steel Twist Drills, Gear and Milling Cutters, Side Mills and End Mills, with straight or spiral flutes and plain or nickeled teeth. Their ability to serve accurately and long equals that of Butterfield Taps, Dies and Reamers — the sincere praise of a thousand users wouldn't be a better recommendation.

The Butterfield Catalog, just off the press, fully describes these better tools and how they increase production. Write for your copy.

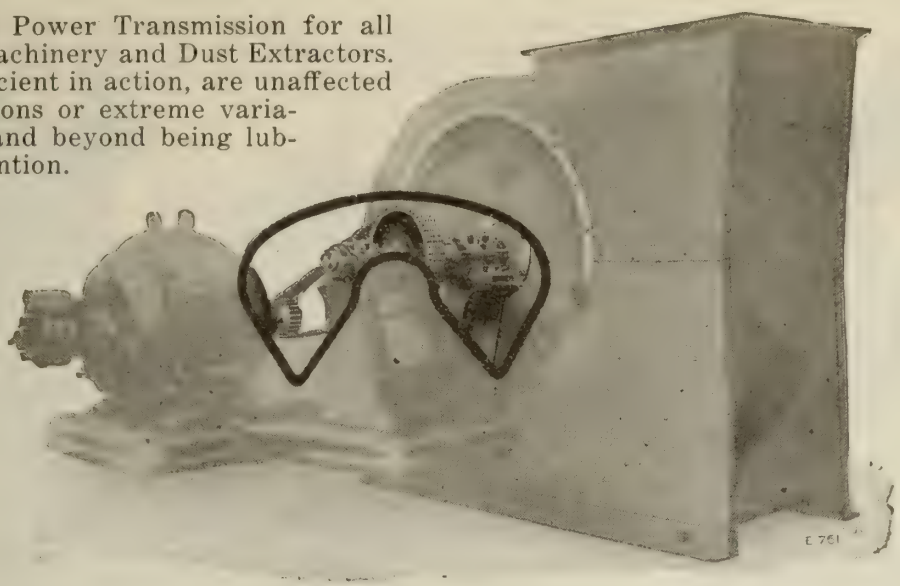
"The Coventry" Noiseless Chains

are the ideal form of Power Transmission for all kinds of Ventilating Machinery and Dust Extractors. They are silent and efficient in action, are unaffected by atmospheric conditions or extreme variations of temperature, and beyond being lubricated, require no attention.



A 25" Keith fan, driven by "The Coventry" Noiseless Chain Motor of 7½ h.p., running at 950 r.p.m., fan 400 r.p.m. This illustration shows how floor space is saved by using chain transmission.

Foss MACHINERY AND MILL SUPPLIES

RE-BUILT MACHINE TOOLS

We offer, subject to prior sale, the following Machine Tools, which have been thoroughly overhauled and rebuilt in our own shop and are all in good working condition:

LATHES

1—3 x 36 Jones & Lamson Turret Lathe.

1—20 x 8 Boye & Emmes Lathe, Quick Change Gear, Double Back Gear, complete with Chuck, Taper Attachment, and regular equipment.

2—20 x 8 Boye & Emmes Lathes, Quick Change Gear, Double Back Gear, complete with Chuck and regular equipment.

1—Carroll Jamieson Lathe, 16 x 10, Quick Change Gear, Double Back Gear, complete with regular equipment and taper attachment.

1—Carroll Jamieson Lathe, 16 x 8, Quick Change Gear, Double Back Gear, complete with regular equipment.

2—18 x 8 Mueller Lathes, Quick Change Gear, Double Back Gear, with regular equipment.

2—16 x 8 Pratt & Whitney Turret Lathes.

1—16 x 6 Lathe, complete with Chuck and regular equipment.

1—14 x 6 Monarch Lathe, with regular equipment.

1—16 x 6 Flather Lathe.

2—16 x 6 McDougall Semi-Quick Change Gear Lathes, with Chuck and regular equipment.

1—24 x 16 Lodge & Shipley Lathe, Quick Change Gear, Double Back Gear, with regular equipment.

1—Lodge, Davis & Co. Lathe, 16 x 10, plain type.

1—20 x 36 x 12-foot Gap Lathe, with Chuck.

1—14 x 6 Gardner Lathe, with Chuck and regular equipment.

2—14 x 6 Sebastian Lathes, with Chucks and regular equipment.

1—16 x 8 Gardner Lathe, with Chuck and regular equipment.

1—26 x 40 x 12-foot Bertram Gap Lathe, with Chuck and regular equipment.

2—20 x 8 All Geared Head American Lathes, with Chuck and regular equipment.

HACK SAW MACHINES.

17—No. 1 Racine Hack Saw Machines.

1—Rapid Cut Hack Saw Machine, 8" capacity.

DRILL PRESSES.

1—20" Buffalo Back Geared Drill Press.

1—24" Snyder Sliding Head Drill Press.

1—Mechanics Machine Co. 24" Sliding Head Drill Press.

1—36" Sibley Sliding Head Drill Press.

1—22" Sibley Sliding Head Drill Press.

1—16" Sipp Tool Room Drill ⅞ capacity.

1—W. B. Knight Universal Tool Room Drill.

1—20" Back Geared Excelsior Drill Press.

GRINDERS.

2—Wilmarth & Morman Surface Grinders.

1—No. 2 Brown & Sharpe Surface Grinder with magnetic chuck.

1—Stevens Cutter Grinder.

2—Gardner Surface Grinders.

MILLING MACHINES.

2—No. 21 Garvin Milling Machines.

1—No. 3 Cincinnati Universal Milling Machine with regular equipment.

1—No. 2 Ford Smith Plain Miller, complete with dividing head and vise.

1—No. 1½ Cincinnati Universal Miller, complete with regular equipment.

PLANERS.

1—30 x 30 x 8′ Bertram Planer.

1—20 x 24 x 6′ Whitcomb-Blaisdel Planer.

1—12" Xant Brothers Buzz Planer.

SHAPERS.

1—16" Back Geared Walcott Shaper.

RADIAL DRILLS.

1—Mueller 3-Foot Radial Drill.

We are open at all times to consider the purchase of entire plants, or individual machine tools in good condition.

BOOST THE VICTORY LOAN!

Get on a Train and See Your Security

If you were to board a train at Halifax or Vancouver and ride for 3,500 miles across this broad country—you would see something of the security behind the Victory Bonds. You would ride for a week—but even then you would only see a narrow strip of Canada's hundreds of millions of acres—a country nearly twice as large as all Europe. You would see

the farms and forests
the prairie and plains
the mines and the mills
the docks and the elevators
the steamers and the railroads
the cities
the towns

All this is the security behind your Victory Bonds.

This is the security that makes Victory Bonds one of the world's premier investments. Victory Bonds are the safest securities. Victory Bonds pay a good rate of interest—nearly twice as much as Savings Banks. And you know how vital it is to Canadian Prosperity—and your own welfare—that the Victory Loan shall be successful.

It means that Canada's prosperity and your own prosperity will continue.

So don't buy just enough Victory Bonds to "square your conscience." Buy to the limit of your ability.

Do your part in making the Victory Loan a huge success.

Put your present savings into Bonds and borrow against your future earnings.

Buy Victory Bonds

Do It Again

The reaction from war to peace has been sudden and strong. Our courage may be a bit spent, our enthusiasm for service a trifle on the wane.

It needs a little effort and some determination to rekindle the old fire, but it must be kindled if the Victory Loan is to be a success.

Canada calls upon you, therefore, for a renewal of your faith and a renewal of your effort.

And that can best be expressed if you do your utmost to inspire people to

BUY VICTORY BONDS

P.S.—There is an old saying to the effect that "if you can't sing the words you can whistle the tune."

If you haven't any ready money, borrow some and

Canadian Machinery and Manufacturing News, November 6th, 1919, Vol. 22, No. 19. Published weekly at 143-153 University Ave., Toronto, Canada. Subscription price in Canada, $3; United States, $3.50. Entered as second-class matter at the Post Office Department, Ottawa, Canada. Entered as second-class matter July 1, 1912, at the Post Office at Buffalo, under the Act of March 3rd, 1879.

Canada Fights to Win

When Canada fought—Canada fought to win.

We are now in the midst of another campaign.

The Victory Loan is a campaign to raise money to pay the obligations that the war has left us, and to keep Canada prosperous.

The Victory Loan 1919 calls for vigorous individual and concerted action.

It is a national platform on which all citizens concerned in their country's prosperity and welfare can, without reservation, take a strong, emphatic stand.

The Victory Loan 1919 is the "clean up" chapter in Canada's War History—it is needed to round out the most glorious of our achievements.

It is needed to "carry on" the National Business—to successfully bridge the period from War to Peace—and to speed our country along the highway of international commerce in successful competition with other great nations.

Your personal co-operation is imperative.

Your support is vital.

It is unthinkable that Canadians—united for years when things looked dark—would not, in the same spirit of patriotism, unite in this last great war effort.

Let us show the world again that what Canada undertakes Canada accomplishes.

ANNOUNCEMENT

THE ALGOMA STEEL CORPORATION, LIMITED, take pleasure in announcing to their customers and the Canadian trade that in accordance with the widespread desire throughout the Dominion that there should be obtained in Canada with Canadian labor, a much larger proportion of the requirements of this country in STEEL SECTIONS for STRUCTURAL PURPOSES, CAR CONSTRUCTION, SHIPBUILDERS' REQUIREMENTS, etc., they are just completing extensive alterations and additions to their rolling mills, and on or about 1ST NOVEMBER, will be ready to produce and ship American Standard Sections of BEAMS and CHANNELS up to and including 15″, all standard sections of ANGLES from 6″ x 6″ down to 1¼″ x 1¼″, ZEE BARS for car builders and general purposes, small and large ROUNDS and SQUARES, and FLAT BARS up to 14″ wide. The quality of the product is already well known to the trade, and is exclusively steel made by the Open Hearth process. and can be furnished in all grades from the softest rivet stock to high carbon special spring material.

MARK OF ALGOMA O.H. QUALITY

The following are the sections which will be rolled:---

ANGLES—Equal Leg—
6 x 6″—5 x 5″—4 x 4″
3½ x 3½″—3 x 3″
2½ x 2½″—2¼ x 2¼″
2 x 2″—1¾ x 1¾″
1½ x 1½″—1¼ x 1¼″

ANGLES—Unequal Leg—
6 x 4″—6 x 3½″—5 x 4″
5 x 3½″—5 x 3″—4½ x 3″
4 x 3½″—4 x 3″—3½ x 3″
3½ x 2½″—3 x 2½″—3 x 2″
2½ x 2″

BEAMS—
15″, 12″, 10″, 8″, 6″, 5″, 4″, 3″.

CHANNELS—
15″, 13″, 12″, 10″, 8″, 6″, 5″, 4″, 3″.

ZEES—
3¼ x 5 x 3¼ x 5/16
3 5/16 x 5 1/16 x 3 5/16 x ⅜″
3⅜ x 5⅛ x 3⅜ x 7/16″
3 1/16 x 4 x 3 1/16 x ¼″
3⅛ x 4 1/16 x 3⅛ x 5/16″
3 3/16 x 4⅛ x 3 3/16 x ⅜″
2 11/16 x 3 x 2 11/16 x ¼″
2¾ x 3 1/16 x 2¾ x 5/16″

ROUNDS—
All sizes from ½″ up to and including 4″.

SQUARES—
All sizes from ½″ up to and including 3″.

FLATS—
All sizes from 1 x ¼″ up to and including 14″ wide.

MINE RAILS—
All sections from 12 lbs. up to and including 45 lbs. per yard.

PIG IRON—
Machine cast FOUNDRY MALLEABLE and BASIC.

SULPHATE OF AMMONIA.
NITRE CAKE.

For the better convenience of customers who may find it necessary to secure rush shipments of particular items, they contemplate keeping a large stock of all the various standard sections constantly on hand, and to this end extensive warehouse facilities are being prepared.
Your enquiries and business will be appreciated.

ALGOMA STEEL CORPORATION

SAULT STE. MARIE, ONTARIO

"Oakite Saves $83.52 Weekly on Cleaning"

ONE cleaning operation in this plant is the washing of small brass parts which are covered with rubber compound—hard to remove.

Formerly used 74 pounds of soda ash daily—and 5 girls were employed in scrubbing the parts with soap after leaving the tank, to remove sediment caused by soda ash.

Oakite has replaced the soda ash. Only 5 pounds of Oakite are used daily. The work comes from the tank absolutely clean. No sediment. No scrubbing. The girls are being usefully employed elsewhere in the plant.

Oakite has saved this plant $13.92 *daily* in this one cleaning operation alone—or $83.52 a week.

This Advertisement is one of a series based on actual occurrences.

Just another reason why it pays to have an Oakite Service man pass judgment on YOUR cleaning room. Competent advice without obligation.

Correspondence Invited

OAKITE MANUFACTURED BY OAKLEY CHEMICAL CO. 26 THAMES STREET · NEW YORK

The Cameron Pump and Simplicity

Simplicity is one of the main features of Cameron design. Nothing fussy is incorporated in the design of any Cameron pump and easy access for cleaning is kept in view. The centrifugal Cameron is horizontally split, so that water connections do not need to be disturbed for inspection. Steady service is insured by careful construction, and so certain are we of the reliability of the Cameron pump that every pump is sold with a liberal guarantee.

Bulletin 7150 shows typical Cameron pump efficiency curves---based on average performance

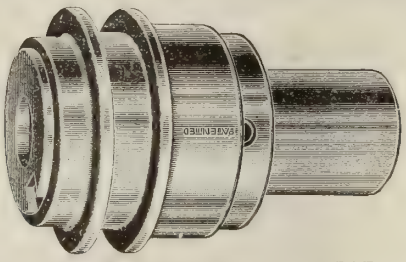
THE JOHNSON FRICTION CLUTCH



SINGLE CLUTCH--EXTERIOR

THE SIMPLEST WAY—AND THE BEST

In a clutch or any other mechanical device, unnecessary complication means trouble. Make a single part serve where two have been used before, and you have reduced by one-half the places that can break, wear or get out of adjustment. Put the cost of **extra** material into **better** material, and you have doubled the length of service.
In the Johnson clutch, this idea has been followed out to its practical limits. The result is a model of simplicity in clutch construction—a few sturdy parts, each correctly built and accurately tested for the duty it must perform. This lack of complication means continuous service and low maintenance cost. Johnson Friction Clutches stay on the job.

WE CAN BUILD TO SUIT YOUR NEEDS

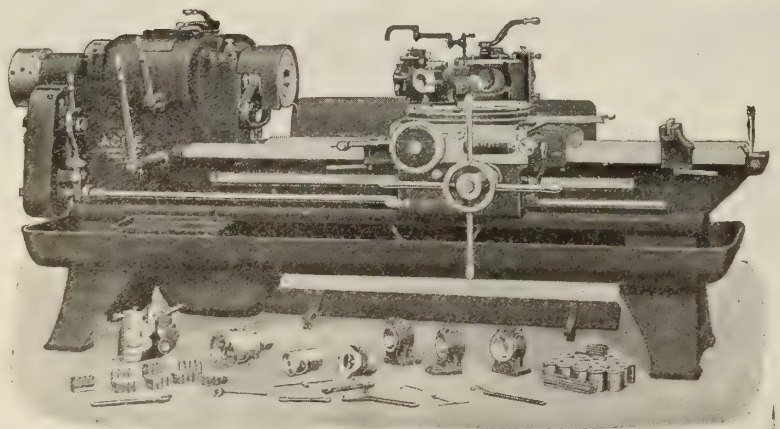
Doubly Efficient—Does Both Bar and Chuck Work

This Cincinnati Acme Flat Turret Lathe is a double-production, geared head machine of the sliding gear type. It operates on minimum power because the only gears running are those doing the actual work.

This machine saves remarkable time and labor machining either bar work or chuck work up to 16 in. diameter.



3½ in. x 36 in. Flat Turret Lathe, Equipped for Bar Work.

Head is cast solid with the bed. You know what that means: accuracy, rigidity, constant and perfect alignment of spindle with vees, upon which the turret carriage travels.

We also make a full line of Screw Machines and Turret Lathes.

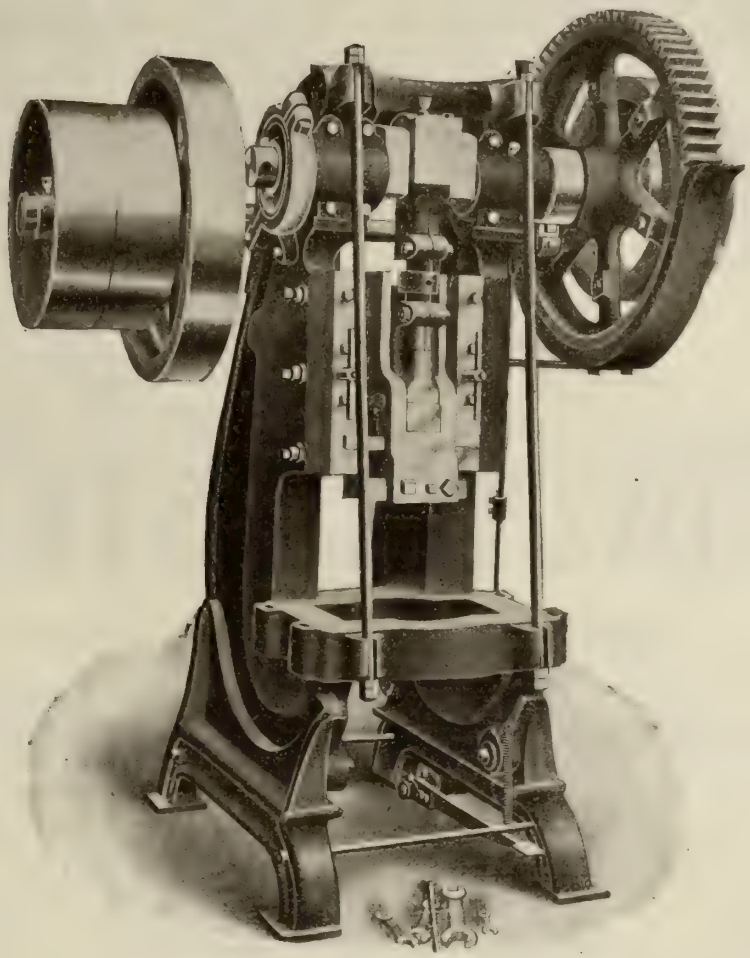
For Your Pressing Needs



No. 215 Inclinable Geared Press

Quality that is **"Built In"** stands out on all B.B. Power Presses.

The long slides insure accurate work and long life to your dies. The steel pitman screw gives added strength at a vital point.

The Crankshafts are made from high carbon steel forgings and are **"Heat Treated"** so as to give the maximum shock-resisting qualities and prevent crystallization. This is a feature no other press manufacturer can claim.

Let us quote on your next presses. The machines are the best that can be produced and our prices are low in comparison with the value you will get.

An Exchange of Money That Pays

When you buy Victory Bonds, you simply exchange one kind of money for another.

A dollar bill is Canada's promise to pay.

So are Victory Bonds.

But Victory Bonds pay INTEREST.

Consider the security behind Victory Bonds—

Canada and all that is contained therein.

Consider the good rate of interest—

Victory Bonds pay 5½%—nearly twice as much as Savings Banks.

Consider the saleability of Victory Bonds—

Their use as collateral for a loan.

Their prospective advancement in price.

Consider the purpose for which Canada requires the money:—

Cleaning up our obligations to the army and maintaining the prosperity of the country.

Are not these reasons the best in the world for exchanging one kind of money for another?

Should not every Canadian put all his weight behind this Loan?

Should not he exchange all the money he has for Victory Bonds?—and all the money he can save for the next ten months to come?

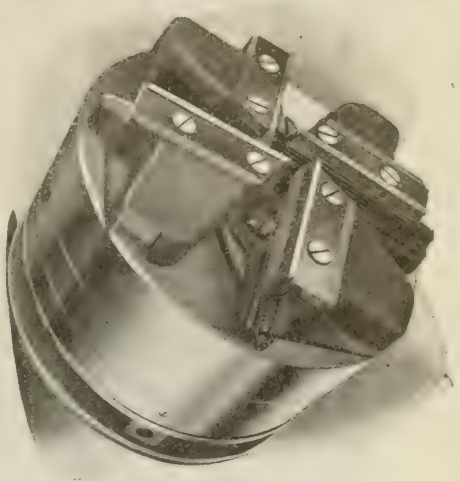
APPLY THE LANDIS DIE HEAD TO YOUR THREADING MACHINE

Landis Bolt or Pipe Threading Heads applied to your threading machine give you all the advantages of the Landis chaser. The application is very simple, merely requiring an intermediate flange which we will gladly furnish.

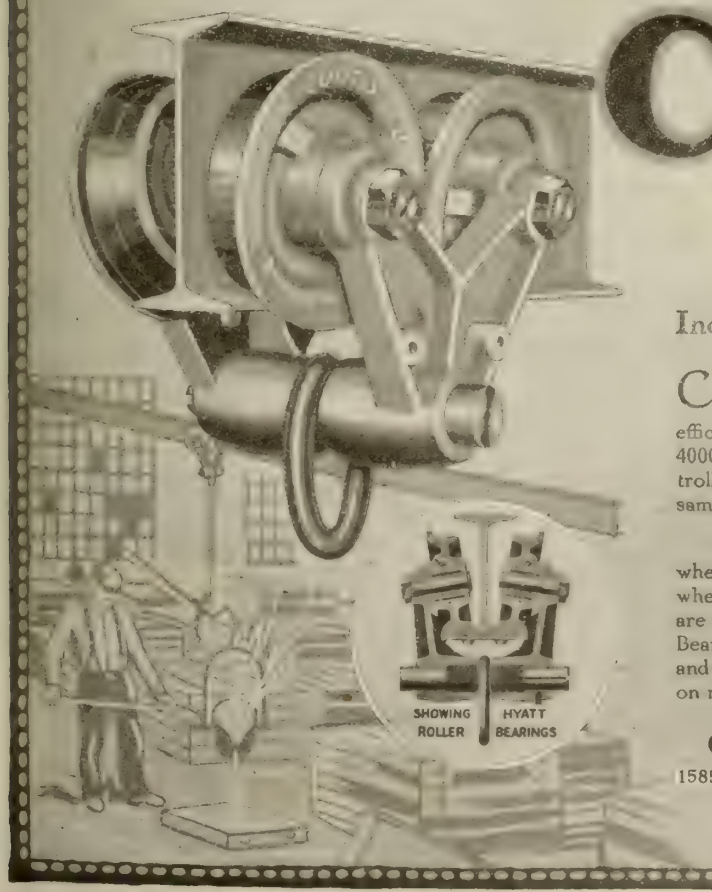


The Landis head on your old machine will revolutionize threading in *your* shop just the same as it has in many other shops. You will then appreciate the variable rake or cutting angle of the chaser, the interchangeability, the absence of annealing, hobbing and retempering and the exceptionally long life.

Landis heads are daily being applied to other makes of threading machines and our customers report better threads, double production and a much lower cost of upkeep. Landis-ize your shop. Get full details at once.

LANDIS MACHINE COMPANY

Waynesboro, Pa.



CURTIS TROLLEYS

Increase Production—Save Man-Power

CURTIS Single I-Beam Trolleys are being used by progressive firms demanding the highest operative efficiency. A Curtis Hyatt Roller-Bearing Trolley with a 4000-lb. load can be moved by a 50-lb. pull, while ordinary trolleys require nearly twice as much power to move the same weight.

Curtis Trolleys are constructed with large inclined wheels and self-equalizing steel side-frames—so that each wheel always bears its rightful proportion of the load. They are equipped with shock-absorbing Hyatt flexible Roller Bearings—which make the trolleys easy-starting, easy-rolling and long-lasting. Full information and descriptive literature on request.

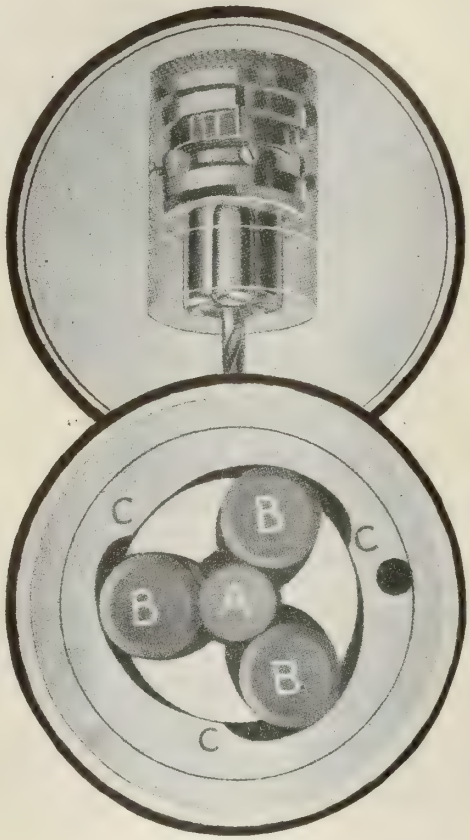
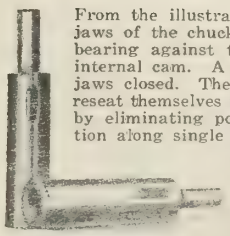
SKF AUTOMATIC-QUICK ACTING SELF CENTERING DRILL CHUCKS

Suggestion No. 3 →

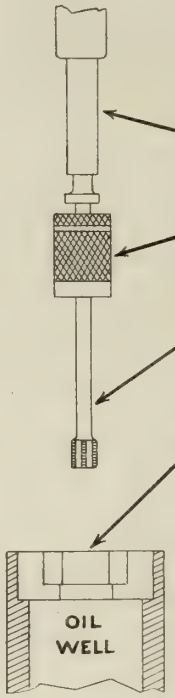


A—*Drill Shank*
B—*Roller Jaws*
C—*Cam Surfaces*



Increase Size Range by using Adapters

From the illustration it will be seen that the jaws of the chuck are formed by three rollers bearing against the surfaces of a three-lobed internal cam. A coiled spring holds the roller jaws closed. The rollers are free to turn and reseat themselves with every drill release, thereby eliminating possibility of wear or indentation along single line of contact. The drilling resistance forces these rollers up the cam surfaces, causing them to close upon and grip the drill shank with a power always proportionate to the drilling stress, thereby precluding slipping of the drill under any conditions whatsoever.



The Drill Spindle keeps turning in one direction continuously

AS each nut is tapped the drill spindle is lifted and the nut is carried up on the shank of the tap. When the shank is filled, the whole tap is taken from the S K F Chuck, the nuts dropped off, and the tap reinserted—all without stopping the drill spindle.

The same S K F Chuck that makes this possible has set new standards for automatic drill chucks—with its perfect centering device, its special roller jaws, and its entirely automatic action.

There is no limit to the uses to which the S K F Chuck can be put. Our engineering service department is at your call.

Can You Forget?

As long as you live you'll remember November 11th, 1918 —Armistice Day.

That was the day the enemy surrendered.

That was the day of Victory for our army.

Day after day—year after year—through rain, cold, heat, mud, death—they had fought bravely, stubbornly, cleverly, faithfully—the spearhead of fate pointing inexorably at the black heart of the enemy.

Remember the Somme? Ypres? Vimy? Passchaendale? Cambrai? MONS?

Can't you catch this brave spirit?

Can't you see how small is our task compared with theirs?

Shall we fail to lend our money to the country for which they gave their lives?

The Victory Loan 1919 must be a victory, too. It is needed to pay our obligations to the army and to keep the fair name of Canada writ high among the nations.

This is a War Loan.

Canada needs to borrow your money.

If the Victory Loan succeeds it will be another Mons for Canada.

Let us show the world again that what Canada undertakes, Canada accomplishes.

ELECTRITE

High Speed Steel

SEVERAL factors combine to make this high-speed steel a triumph of the steel-maker's art; Electric Furnaces — entirely infallible, automatically regulated, delivering the same result time after time.

Uranium — This rare element, cousin to Radium, effects a profound change in the texture and quality of the steel.

Added to these, the constant care and skill of years of steel-making experience make the result of each melt a foregone conclusion.

ECONOMY IN GRINDING STATIONARY GAS ENGINES

The John Lauson Mfg. Co., of New Holstein, Wis., at whose factory the above photograph was taken, makers of stationary gas engines, are convinced that the Heald No. 60 Cylinder Grinding Machine increases production and accuracy, while reducing the cost of manufacturing by grinding bores.

They have demonstrated that ground cylinders will cut the testing of running in time 50% or better and will produce a more desirable and economical engine.

In their catalogue they state that their cylinders and pistons are ground to size, which assures a smooth, round cylinder that will hold compression under all conditions, will last longer and deliver more power and require less lubricating oil than the bored type.

The above conditions are true not only of stationary engines, but also of every combustion engine, including automobiles, airplanes and tractors. The Heald No. 60 will grind any part which cannot be readily revolved.

We build internal and rotary grinders, also magnetic chucks. Literature on request.

The Greenfield Universal Grinder

For General Tool Room Work

This grinder is furnished with attachments for grinding all sorts of milling cutters, reamers, counterbores, and other machine shop tools.

It is also suitable for cylindrical, internal and flat work which frequently turns up in the making of tools and jigs.

These attachments are all very simple in design and easily adjusted upon the machine, being graduated so that any desired angles can be at once obtained.

The whole machine is thoroughly well built, well finished, and will be found a dependable, convenient grinder.

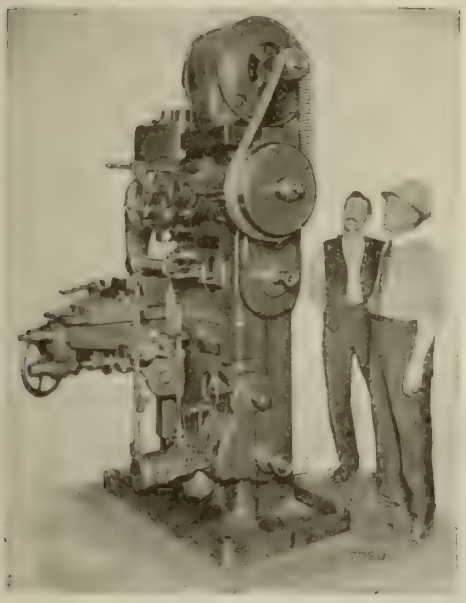
LINK-BELT

SILENT CHAIN DRIVES



For Machine Tools

DRIVE your machine tools with the efficient Link-Belt Silent Chain Drive. In addition to a 20% greater output and a 20% saving in power, you get from four to five times the service on cutting tools, and better finished product.

Remember the following facts about Link-Belt Silent Chain Drives.

1. It is 98.2% efficient (on actual test).
2. Permits convenient location of driving parts.
3. Any reduction in speed is possible.
4. Uniformity of product.
5. Less wear and tear on cutting edges of tools.
6. Increases production.
7. Results in economy of power.
8. Occupies little space.
9. Oftentimes lowers first cost of motors, on account of large speed reduction possible.
10. Oftentimes reduces horse power and cost of motor required.
11. Not restricted to motor drives, but suitable, for instance, for driving from shaft to shaft, as integral parts of machines.
12. Overloads taken care of without diminution of speed.
13. Our casings assure "Safety First" to all employees.

Drawn from photographs showing Goodyear Extra Power Belts at work in the Victoria Foundry Co., Limited, Ottawa.

GOODYEAR
MADE IN CANADA

Reduce Belt Replacement

Changing belts costs money.

Belts which wear out quickly must be replaced frequently.

This costs money for belting.

Costs money for idle machinery.

Costs money for idle hands.

Costs money because piece-workers become dissatisfied.

Goodyear Extra Power Belting reduces belting costs.

It wears long, and so makes the belting itself cost less.

It keeps machinery and men busy, and enables everyone to produce at greatest efficiency.

This has been the experience of ever one of the more than a thousand Canadian plants which use Goodyear Extra Power Belting.

For example, here is what the Victoria Foundry Company, of Ottawa, say about their Extra Power:

VICTORIA FOUNDRY COMPANY, LIMITED, OTTAWA

Gentlemen:

We have certainly had great satisfaction from your "Extra Power" Belting.

We have used it on all kinds of machines. It has been in service a surprising length of time—and is still in service.

For instance—

16 months on the cone of a 30-inch Lodge & Shipley lathe.
18 months on the cone of a 24-inch lathe.
24 months on a 30-inch drill press.
12 months on main drive of a 36-inch planer.

And all still in service. Not a replacement so far. We are mighty pleased.

Yours very truly,

THE VICTORIA FOUNDRY COMPANY, LIMITED.

Men trained by Goodyear to solve belting problems are always available to confer with you. No obligation. Just wire, phone or write the nearest branch.

The Goodyear Tire & Rubber Co. of Canada, Limited

MALLEABLE AND CAST IRON PIPE FITTINGS

M

The Brand That Has The Quality

"Quality" and "Reliability" are two essentials demanded of *Cast Iron* and *Malleable Fittings*, by all sanitary and heating engineers.

Time and money are lost by improperly made fittings. All our cast iron and malleable fittings are properly recessed and every fitting bears the above trade-mark of quality.

We make a complete and full line of both flanged and threaded fittings from ⅛-inch up, and can make deliveries from stock, both standard and extra heavy.

When ordering from your jobber be sure you buy---"the brand that has the quality." They are different. A trial order will convince.

International

Malleable Iron Company, Limited

Guelph, Ontario, Canada

Keep Canada Humming

Canada is running a great National Store.

Great Britain and other lands come here to buy our surplus agricultural and industrial products. These are the orders that are keeping Canadians busy and prosperous. That is where the money comes from that is paying our farmers for their surplus products and providing full pay envelopes for our workers.

But Great Britain and our allies are temporarily short of "cash." So Canada must extend them "credit" — just as any storekeeper extends credit to any customre whose financial standing is good.

The success of the Victory Loans 1917 and 1918 made possible the giving of these credits.

Continuation of these credits and the maintenance of our valuable overseas markets—depend upon the success of the Victory Loan 1919.

You will therefore plainly see how closely bound up with the Victory Loan 1919 is the prosperity of everyone in Canada, without exception.

Do not think your individual co-operation "does not matter."

It does matter!

Unless Canadians to the last man support the Victory Loan, it will not be the success that our continuous prosperity demands.

Let every Canadian do his share to keep things humming.

Six Times as Many Pieces per Grinding

This is the record of

DAVIDSONIZED High Speed Steel Tools

in one of the great Philadelphia plants.

The tools were side mills, 5⅛-inch diameter by ⅝-inch face; the stock, cold rolled steel.

The plant had been experiencing considerable trouble in milling this stock because it had been found impossible to obtain anything but a dragging cut which had made it necessary to follow the milling with a scraping operation.

Upon changing to Davidsonized Tools, not only was the number of pieces per grinding increased six times over, but a fine finishing cut was obtained, of such character as to eliminate the scraping operation.

Davidsonized Steel has long since passed the experimental stage. In the light of the daily experiences of prominent plants throughout the country, no fair-minded man can longer doubt that tools of this fundamentally superior steel will give him faster sustained production, reducing tool costs, labor costs and overhead for every piece produced. Write us to-day.

Notes On Grinding
NORTON COMPANY WORCESTER, MASS.

No. 73A

Grinding Wheel Economy in the Foundry

A thorough knowledge of the physical properties of the metal to be ground is the first essential to the economical use of the grinding wheel in the foundry. The selection of the proper abrasive is entirely dependent upon this knowledge.

For materials of high tensile strength—annealed steels, malleable or wrought iron—the best results will be obtained by using ALUNDUM wheels. On gray cast iron, chilled iron, malleable iron, brasses, bronzes, aluminum and copper CRYSTOLON wheels will be found the most efficient.

The size of the wheel, the amount of material to be removed, and the nature of the material readily determine the size of the grain. Finish is seldom a consideration; therefore, it is always best to use as coarse a wheel as practicable.

The speed of the grinding wheel is of the utmost importance, and must be held within the correct speed range of from 5,000 to 6,000 surface feet per minute, if proper cutting action and economy in wheel consumption are to be obtained.

The life of a grinding machine largely depends upon the care it is given—all bearings must be kept adjusted and in good condition—the spindle must be rigid, and the foundation solid. A grinding wheel that vibrates or jumps is soon pounded to pieces by the shocks and stresses from the action of the castings on the face of the wheel.

The personal factor should be given careful consideration. No two men will get the same life or production out of a wheel even though the work and conditions are identical—some work the corners hard, others are abusive in applying the casting, or will remove too much abrasive in dressing. All these factors have their effect and often the manufacturer is unjustly blamed for apparent variations in wheel life when the true cause can be attributed to the personal factor.

An Exchange of Money That Pays—

When you buy Victory Bonds you simply exchange one kind of money for another.

A dollar bill is Canada's promise to pay.

So are Victory Bonds.

But Victory Bonds pay 5½% interest.

Consider the security behind Victory Bonds—
Canada and all that is contained therein.

Consider the good rate of interest—5½%.
Victory Bonds pay nearly twice as much as Savings Banks.

Consider the saleability of Victory Bonds—
Their use as security for a loan—
Their prospective advancement in price—

Canada must have this money to clean up our obligations to our army and maintain the prosperity of our Country.

These are the best reasons in the world for exchanging one kind of money for another.

Every Canadian should put all his weight behind this Loan.

He should exchange every dollar possible for Victory Bonds—and every dollar he can save for the next ten months.

CANADIAN MACHINERY
AND
MANUFACTURING NEWS

Vol. XXI. No. 18 November 6, 1919

Canada Must Work to Secure Export Trade

In Several Cases Dealers in Foreign Lands State That They Do Not Know Anything About Canadian Lines—Openings for Various Lines if Price is Right

SOME time ago CANADIAN MACHINERY sent a circular letter to a selected list of importers in other countries with a view of securing information for Canadian manufacturers. In order that readers may correctly gather the meaning of the letters used here, we give the list of questions asked in our letter:—

1. Openings for goods that might be supplied by Canadian manufacturers that are not at present being sent from here.

2. Changes in tariff or transportation regulations.

3. Hints regarding the proper packing of goods, and things to be guarded against in the method of packing and shipping.

4. Suggestions in regard to catalogues and advertising matter sent out from Canadian firms. Should these be in languages that are not now sent out? If so, what changes are desirable?

5. What financial arrangements should be made? What system of arranging credits is being successfully followed by the manufacturers of other countries?

6. Are there special designs of machine tools or other articles needed for your trade, or is the standard Canadian line suitable?

Swinnock & Palmer, 18-20 Durham St. W., Auckland, Australia—"There is an opening here for store trucks. Documents should be posted properly to ensure being here before the goods. British manufacturers are now so handicapped by shortage of timber and other raw materials that it is now impossible to import at a saleable price, and Australian goods are very inferior and also higher in price."

Not Acquainted With Canada

The Toowoomba Foundry Co., Ltd., Box 109, Toowoomba, Queensland:—"Our trade with Canada has been small, which perhaps has been influenced by our experience with the methods of manufacturers and traders in the United States, which has been anything but favorable.

"We only wish to say in respect of your Question 5, about financial arrangements, that the American system seems to be to demand cash with order, as compared with the British system of shipping the goods with charges paid, and making draft at sight or as otherwise arranged with the purchaser. British bankers cater for business along these lines, but American methods seem to be on different lines, in that facilities are not provided for the sale by manufacturers and merchants of their drafts.

"We have had experience even in pre-war times of an American manufacturer taking two years to execute an order, and then being at a loss to know how to obtain payment, to such an extent that after our waiting for some months for the draft to arrive, we finally remitted from this end, as in the meantime the goods had been in our hands for sometime."

Present Designs Are Suitable

Maynham Tin & Steelware, Ltd., East London, South Africa:—"Opening here for tin plates, steel sheets. Stoves sent to this port are better uncrated. Sheet iron mostly in felt-separated bundles. Very rough handling is given goods here. System of letters of credit ties up for months quite a lot of money. Four to five months' indents have to be paid for in advance, which was never done in pre-war days. As far as we know existing designs of Canadian machines are suitable here."

The Market in Sweden

Aktiebolaget, Rylander & Asplund, Stockholm C.:—

1. The importation to Sweden of Canadian-made machinery is not very large, and never was, but as per our opinion, Canadian goods could get rather a good market over here providing they could compete successfully with goods made in U.S.A., with regard to prices as well as qualities.

2. No changes have occurred to the customs tariff and no special transport regulations with Sweden have to be reckoned with.

3. We feel this question needs not to be specially spoken of, the proper methods of packing machinery being well known to all manufacturers. An important point in this connection is, of course, that machines must be very carefully greased and oiled for the long transportation, especially during the present scarcity of shipping room, causing now and then long storage periods in the export ports.

4. Sufficient stocks of describing and illustrating material is needed to the Swedish importing dealers. Catalogues could gladly be printed in English, this language being sufficiently known to all Swedish engineers and mechanical men of any authority.

5. Providing this question asks for a reply referring to normal, not war, conditions, the reply is that exporters of other countries are generally allowing to the Swedish importers a 3 months' credit, or a cash discount when paying within 30 days. These are the usual terms, which, of course, are subject to slight modifications. Only firms unknown to the foreign sellers, or firms of less capacity, are asked to pay in advance or against shipping documents.

6. We regret to have only little personal knowledge of the standard Canadian machine line, owing to the fact stated above under (1), but we are under the impression

that the Canadian line is following the U.S.A. line with regard to the general designs, and if so, no special changes need to be made to suit the Swedish market.

The right way to get Canadian machines successfully introduced on the Swedish market would no doubt be that the Canadian manufacturers had their interests taken care of by active and capable Swedish dealers on basis of sole agencies. This is the method usually adapted by the leading U.S.A. and British manufacturers, and which have proved, we believe, to give satisfaction to both parties. It no doubt would be worth while that the Canadian manufacturers sent representatives over here to enter connections with the proper Swedish importers; in this connection we wish to mention that many Swedish importers have sent representatives over to U.S.A. as soon as the relieving of war restrictions made such journeys possible, but we are under the impression that only in very rare cases these journeys are extended to Canada, which is due to the fact that the Canadian manufacturers are comparatively unknown over here.

We wish to repeat what we have said above under (1), viz., that the hardest competition for the Canadian manufacturers is that from U.S.A., and if it would mean a hard job to the Canadians to get introduced in Sweden, the job certainly would be worth while.

Care Needed in Packing

George H. Alexander, Coleshill St., Birmingham, England:—

1. All classes of machine tools and small tools at present supplied by the U.S.A. might be supplied by Canadian manufacturers.

2. Impossible to say what changes are likely to take place in either tariff or transportation.

3. Very important to pack machinery in such a way that the flares, guards and all the light parts of the machine should not be broken in transit. Breakages of parts like this, which are difficult and expensive to replace is one of the troubles that should be guarded against.

It is important to thoroughly grease or protect with anti-rusting material all the bright parts of the machine, and to see that thick oil is well soaked into all the slides and operating parts of the mechanism.

4. For this market, English is all that is necessary, but a good supply of advertising matter, apart from the catalogues, i.e., all the talking points, should be liberally supplied.

5. The present financial arrangements are satisfactory for general purposes, in special cases it is necessary to arrange for extended credit.

Machine Tools Are Wanted

The Meadowbank Manufacturing Co., Works and Head Office, Meadowbank, near Sydney, New South Wales:—In response to your circular, we may express our appreciation generally of CANADIAN MACHINERY, and regret that we cannot help you so much as others on account of our small experience with Canadian goods.

Answering your questions:—

1. There should be good opening for Canadian machine tools. We, ourselves, are looking for:—

A small turret lathe after the style of "Warner-Swasey."

A drilling machine with multiple adjusting head, similar to that advertised—"Whole Hog."

A good type of rotary cutting machine in connection with shaping panels for motor bodies, similar to "Quick Work."

A machine for rolling mudguards for motor bodies.

A wood-working machine for using up scraps of timber by jointing and gluing.

Generally speaking, such lines as bolts and nuts, screws, and general hardware are in good demand, also steel.

We are particularly asking for a quantity of pig iron suitable for making malleable castings.

In addition, will you please tell us what Pyrometers are used in Canada in connection with malleable iron foundries?

2. A complete revision of our tariff is contemplated, and you will be able to obtain full particulars in due course.

3. Cargo, if reasonably well packed, reaches us in good condition by steamer. Sailers are to be avoided on account of rust.

4. Catalogues are all right, but price lists should accompany them.

5. Australian buyers generally settle by draft at sight or terms.

6. What suits Canada ought to be quite good for Australia.

Some Chance in Cuba

Ernesto A. Carcas Y Ca., Aguiar No. 110, Habana, Cuba:—We are at the present time endeavoring to get in touch with responsible machine manufacturers for the manufacture of **Asbestos-cement, corrugated sheetings, tiles, slates, etc.,** as are being manufactured in the United States, England, etc. We are interested in purchasing the necessary machinery for the manufacture of these articles, and shall appreciate mightily if you will have the goodness to refer our request to responsible manufacturing firms in those lines, and to take the matter up with us at once.

A Cheap Machine Wanted

James Greaves & Co., P.O. Box No. 406, 11 and 13 Ridgefield, Manchester:—We are in receipt of your circular letter with reference to your Export Number of CANADIAN MACHINERY, and this we are sending out to our correspondents in India for their information. Our lines of business, however, are chiefly confined to textile machinery. We also ship machine tools to India, but they are chiefly the cheaper type of lathes, which are required for grooving the leather rollers of cotton gins. Before the war, we used to buy these lathes in Yorkshire, at about £37 each, including 8 screw bell chuck, 14 in. independent four-jawed dog chuck, index plate, countershaft and 22 change wheels. The lathes have 8 in. centre by 10 ft. gap bed, and include self-acting, sliding, surfacing and screw-cutting motions. If, however, you have a cheap lathe that would fill the above specifications, we shall be pleased to hear from you, although we can quite understand that prices now will be dearer than they were prior to the war.

Charles Booth & Co., Engineers' Tool, Steel and Machinery Warehouse, Booth's Buildings, Park Lane, 38, 40, 42, 46, and 48 Park Lane, Liverpool:—In reply to your circular letter, we consider that there is a large outlet for cheap machets and shall be glad if you can put any makers in touch with us. They are a very cheap article, but are used in very great quantities.

Interested in Machine Tools

T. Eilbeck & Son, 2-8 John St., West Perth, Western Australia:—At the present time with the exception of a little agricultural machinery and Ford Cars, we know of very little Canadian manufactures imported to this State.

We find that most American goods are well packed and shipped, and presume that the Canadian manufactures would be packed in a similar style.

As we have not been in touch with any Canadian firms except through London buyers, we can pass no remarks about their catalogues. It is certain that your journal reaches most firms here, and is well known, and the advertisements in such a journal reach the source for which they are intended.

Most of our business has been done with English and American firms. We have usually paid cash against sight draft this end. In the case of firms whom we represent, goods are forwarded on consignment to us payable within twelve months from the time of delivery. We think most probably this is the same system as adopted by your manufacturers.

Machine tools are a line in which we are very interested. We find that the American and Canadian lathes, for instance, are not adapted to our market. Most of the engineering shops handle all classes of work, and the straight bed lathe is not suitable, and very few are sold compared with the gap bed. The same remarks apply to a number of their tools, which in the American markets are made for repetition work, and are not suitable here, because we have not the population to give that repetition work which would require the use of such tools. All machine tools used with a few exceptions are for general all-round work, and have to be selected accordingly. We find that there is more demand for the English type of machine than for the American of this kind.

General. We are ourselves manufacturers of wire nails and other such lines, and cannot remember having been approached by a direct representative of one of the Canadian steel firms, whose agents in most cases are in the Eastern States of Australia. As we are over 2,000 miles away from the Eastern State, naturally we are practically isolated, and have to get in direct touch with the manufacturers, thus we usually buy through London. We would be pleased to answer any questions within our capacity regarding this market.

About the South African Market

Especially prepared by MR. W. J. EGAN, Canadian Trade Commissioner to South Africa.

Documents—It is essential that one copy of invoice and non-negotiable BILL OF LADING should reach customers in South Africa on or before the arrival of the carrying steamsr. Selling to arrive, is a big factor in South African trading. Overseas customers should be advised as far ahead of actual shipment as possible, of the consignments coming forward. Other countries shipping to South Africa follow the above practices and as trade will always follow the line of least resistance Canadian shippers must conform or lose the trade in hand.

Invoices—On all invoices with C. I. F. quotations invoice must state the amount of the ocean freight. The face of invoice declaring true value at the time of shipment should correspond with the declaration on the back of invoice.

Insurance—Place all your overseas customers' INSURANCE with companies represented at destination; when this is not done, claims are delayed in settlement from nine to fifteen months. There are other difficulties, but the one quoted is enough to bring home the reasonableness of the demand.

Drafts—South African merchants want their drafts through their own BANKS. Many importers have stated that so little attention has been paid by Canadian shippers to their instructions that for the future they will stipulate on all order forms, that they reserve to themselves the rights of refusing acceptance of goods unless their instructions re DRAFTS are followed.

Shipping—Remember that shipping "overseas" is not the same as "inland." The packing must be strong and yet not cumbersome. Do not leave batten space which eats into delivery costs.

When you use iron hooping on cases see that it is a hooping and not a baby ribbon. Every case, crate, barrel, bale or single bar of iron should be marked in such a way that the name of the port of destination is always in evidence.

Heavy bales should be strapped and not tied with string or light rope for overseas shipping.

The test of your success in export can be judged by the repeat orders.

Make your first three or four shipments so perfect that it only requires representation to hold and increase future business.

If your shipping methods are such that your represensative is always fighting a battle to excuse your errors, what is the result? You will lose your representation as well as your business and the good representative is not easy picking.

You should by personal visits and inspection, see to it that the shipping department is living up to its job.

Keep the shipping department impressed with the fact that shipping 8,000 miles overseas is not the same proposition as say, from Hamilton to Toronto.

Remember always that comparatively the initial order is easy to take, it is the SHIPPING METHODS that count. Make your shipping department so thoroughly efficient that your overseas client will always remember what a smooth job it is to cost and pass the Customs entrees on your goods. When he thinks of the line you manufacture it is the name of your firm that is before him, although he may have on file fifty other manufacturers of your article.

Department of Trade and Commerce,

Ottawa, July 19th, 1919.

DRAWING COURSE PRIZE ANNOUNCEMENT

OWING to the poor class of work sent to us on plates Nos. 1 and 2, we cannot, to do justice to these plates, award the usual three prizes. Two prizes, however, are awarded to plate No. 1, and one to plate No. 2. The names of the lucky ones are shown below.

On plate No. 3 every scholar fought shy of this plate, although lettering is of such importance, so no awards can be given for this section.

Plates for Nos. 4 and 5 are still coming in nicely and we are glad to say that the class of work is steadily improving.

Our advice is this—stick to it, send in your work—and secure a prize.

We have definite word to the effect that considerable numbers are following this course, yet they seem to refrain from sending in their work. Once more let us repeat: We wish to see the result and will, if necessary, suggest where improvement can be made.

Following are the prize winners: Plate 1—Earl Forrest, 182 Albany Ave., Toronto, Ont.; G. Arundel Lamb, 36 Homewood Ave., Kitchener, Ont.

Plate No. 2—George W. Hibbard, 45 Riverside Drive, Cottage No. 3, Lachine, Que.

Canadian Machinery As An Advertising Medium

By J. H. M.

THERE is a saying that no matter where we go we will meet with a doubting Thomas, and, of course, the same holds good as far as advertising is concerned.

"You've got to show me," is a favorite expression of these Missouri inhabitants, so following is proof of the most convincing character. To commence with, the writer is not connected with the advertising staff, but merely one of the editorial department. He was not in search of a glowing tale regarding the possibilities of advertising, but he was out to find how business in general was going.

The gentleman whom he interviewed was S. L. Clark, Esq., of the Perfect Machine Tool Company, Galt, Ontario.

"How's business?" was my first question, and the reply was as follows: "Splendid. We are doubling our foundry capacity and intend doubling our machine shop space directly after."

Naturally, such a reply was encouraging.

"How do you account for this rush and where is the work coming from"? was my next query.

"To your first question I would say that this is the result of producing a first-class article and advertising the same judiciously and wisely; secondly, that our orders are coming in from all over the Dominion of Canada and Great Britain," was his reply.

"Evidently you are a firm believer in advertising," I said.

"I certainly am," was the reply. "Here are my views on the subject:

"In advertising, just the same as in anything else, good judgment must be used. You must study where to advertise, when to advertise and how to advertise. Each feature is equally important. You can spend more money foolishly through advertising than in any other way. In some cases I would not give five cents for space which they ask $10.00, $20.00 or $30.00 for, simply because I believe that no results would be obtained. In other words, I pick carefully where I advertise. I am a firm believer in the possibilities of export business and have secured inquiries from England, France, Spain and South America through judicious advertising in CANADIAN MACHINERY. We have made good connections already in England and hope soon to make connections of like nature in the other countries mentioned. The man who advertises is bound to go ahead, providing that the article he is advertising backs up every statement in his advertisement and he uses judgment in what he puts before the buying public.

"Personally, I cannot speak too strongly for the cause of advertising, and I firmly believe that CANADIAN MACHINERY, as an advertising medium, has helped us considerably in our present business expansion."

Accidents Have Taken a Back Seat in This Plant

Power Presses Are Generally Conceded to be Dangerous Machines to Operate, But the Various Safety Devices Herein Described and Illustrated Have Made the Press Operators' Work Perfectly Safe

By J. H. MOORE, Associate Editor Canadian Machinery

SOME twelve to fourteen years ago, the writer was engaged in the pleasant (?) occupation of pushing various three-wheeled trucks filled with tin cans acros the floor of a certain can-making factory. While making these daily journeys it used to be a common sight to see some press operator suddenly give a yell and jump up off his stool, but not before he was minus a finger, or perhaps a goodly portion of his hand.

One got hardened in time to these sights, which were, as a general rule, of daily occurrence. Even the operators themselves seemed to realize that they were engaged in a hazardous task, and simply made the best of it.

No one ever thought of properly safeguarding these presses. The danger was ever present, yet still it remained with no real serious attempt to minimize it or to eliminate its existence.

Certain half-hearted attempts were made to place some sort of protection in front of the punch, but no serious thought was given to the problem, with the result that the trouble went on as usual, in spite of the fact that accident reports showed that more injuries occurred on power presses than on any other type of machine, with perhaps the exception of the circular saw, which was a close rival for injury toll.

But time works many changes, and now it is the writer's privilege to tell another story of a can-making industry. This time an entirely different tale. Where his first little reminiscence told of lack of safety devices, his second tale is one fairly pounding the words **Safety First** home to his readers.

It is good to know that there do exist firms so interested in their employees' welfare, that they make a careful and special study of the safeguard problem, and the following article concerning the plant of the American Can Co., Ltd., proves conclusively that not only has this firm spent considerable time and money in safety devices, but that the workers in turn appreciate what the firm is doing for them.

To enter an article of this nature is somewhat difficult, for it is not our intention to confine this story to the press room alone, but rather make it general in character, describing the various safety devices throughout the entire plant.

Many of these devices, or appliances, were impossible to photograph to advantage owing to their location, etc., but a written description of the ideas as adopted will suffice for the purpose of explanation.

Regarding the power press problem. We have secured photographs of several press guards in actual operation in order to clearly bring before the reader's eye, how the devices appeared on the press. All data procurable have also been added to the title of each photograph, and in the reading matter following.

It is our hope that readers will obtain benefit from this article and find some of the guards referred to applicable to their own industrial line.

In such case the time spent in studying the material given will be time well spent.

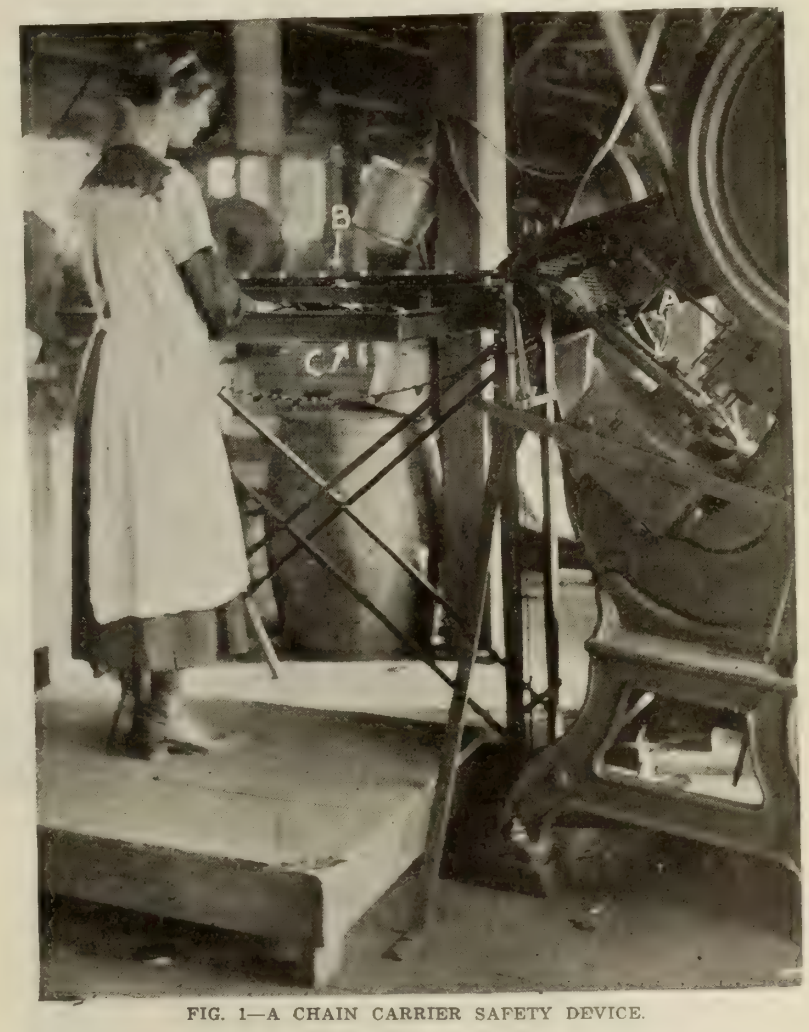

FIG. 1—A CHAIN CARRIER SAFETY DEVICE.

The company we speak of operate sixty different plants, and maintain at their headquarters in New York a safety department regularly organized with a manager and the necessary under organization, whose time is devoted entirely to the furthering of the safety idea, and the general welfare of the employers.

On commencing the tour of the plant the first important point which came to the writer's notice was that of the splendid lighting system (both daylight and artificial), throughout the entire works. This is a matter which unfortunately does not always receive the careful consideration it deserves.

The Woodworking Dept.

Inspection of the woodworking department was next made, and here the safety guards were first in evidence. Every saw was properly protected with an efficient guard, so that the operator could not injure himself without actually removing the guard. All belts, gears, pulleys, etc., which were in any position at all likely to prove dangerous, were properly protected by suitable guards, but of these we will say more later on.

A walk through the entire plant was made, the writer noting down what he believed would interest not only one class of readers of CANADIAN MACHINERY, but all classes, so he will merely set down his impressions one by one, leaving the reader to study from his own angle as how best to adapt the

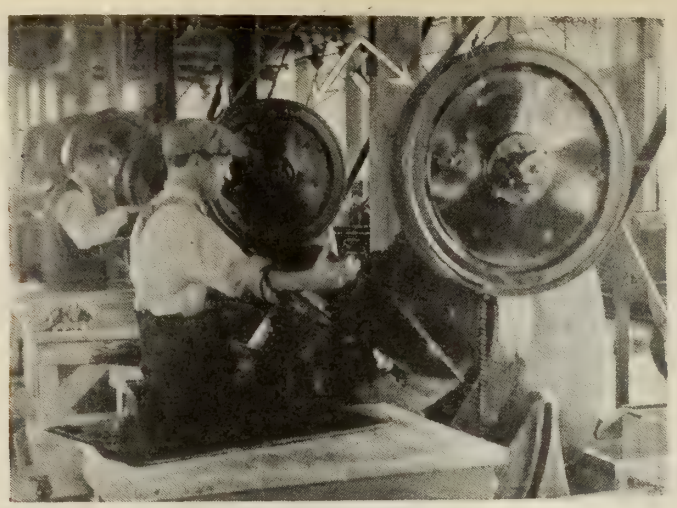

FIG. 2—THE GENERAL APPEARANCE OF THE DISKED FLY-WHEELS ON PRESSES.

various ideas to his own particular conditions.

The Fire Zone System

This firm has adopted a splendid system of fire drill. Every portion of the plant is divided into certain zones, each worker within that zone being thoroughly instructed what they must do in case of fire. Each zone has a certain exit to which the workers in it must go, this feature preventing panic and overcrowding at any one exit. Blue prints showing the layout of plant, with zone areas, exits, etc., all plainly marked, are placed throughout the factory, so that workers can have no excuse for not remembering the instructions given them.

The Elevators

Another safeguard system is that adopted on the various elevators throughout the plant. Each elevator is operated by a carefully trained workman, and all doors at each floor automatically close as the elevator leaves the floor. On each elevator there is a card on which is plainly marked the elevator's capacity, above which it must not be loaded.

Various Type of Guards

Passing through the various departments, one cannot help but notice the multiplicity of guards. They take the form of belt, gear, pulley, rheostat and motor guards. Wherever there is a belt in a precarious position it is suitably guarded by means of a wire mesh guard on an iron framework, or by a cast iron guard if the conditions warrant such a procedure.

Overhead belts especially, are watched carefully, for while these could not very well do any damage so long as they run correctly, they might cause considerable trouble by breaking and coming down on the head of the passer-by.

Gears, pulleys, etc., on all machines are, wherever possible, guarded with wire mesh or tin guards, also in some cases with guards of grey iron. Wall rheostats and motors, either on platform or floor, are all suitably guarded with wire mesh, and iron framework. In other words, in all corners of this plant the safety first idea holds sway.

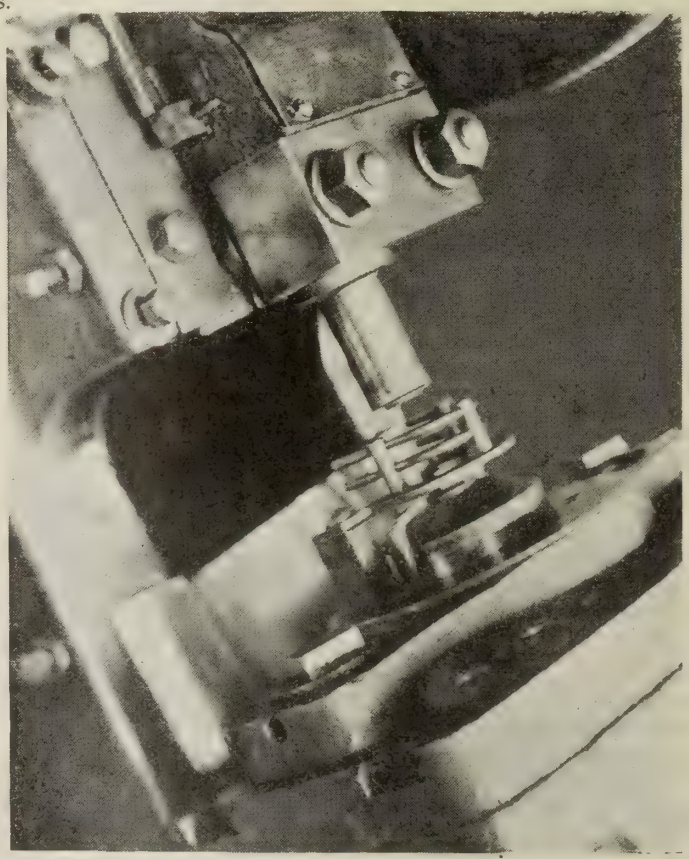

FIG. 3—A SIMPLE AND EFFECTIVE CAGE GUARD.

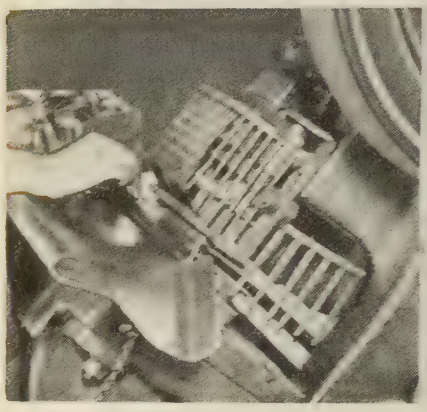

FIG. 4—A SIMPLE WIRE CAGE GUARD.

FIG. 5—SAFETY DEVICE, ADOPTING A CHUTE AS THE SAFEGUARD.

First Aid Room

There is a splendid first aid room situated on the ground floor, with a trained nurse in attendance. The room is modernly equipped in every respect to handle accidents, (but, if one may be allowed to make a comment), the nurse is not overworked since the installation of these various safety devices.

Paper Can Section

In addition to the regular tin cans, etc., which this firm manufacture, they turn out a complete line of paper cans of all sizes. The same feature of belt guards, etc., is carried out in this department, but no guards are necessary on the presses, as these are automatic

in action, the operator never being near the punches while in operation.

The Press Room

Last, but not least, let us consider the press room. As we enter this room the orderly appearance of the presses strikes the eye. These presses are arranged in three main rows, with plenty of aisle space between. At the back of each press is arranged a suitable chute to catch the finished work. In addition to these chutes, plans are under way to instal suitable belt conveyors to carry the work to other presses for further operations. This belt conveyer system is already adopted in the paper can section.

A big safety feature in the press room is the fact that all press flywheels are disked, as can be noticed on one of the accompanying photos. The same plan of covering the spokes of the wheels is carried out throughout the entire plant. The advantage of such a scheme needs no comment for its value is self apparent. The workman cannot get his clothing caught on such a wheel as has often happened with the spoke variety.

Portable floor cranes are provided to help the workman place his dies on the press, and speaking of dies brings us up to the method this firm has of storing their dies not in actual use.

Suitable shelves are built up and divided off to accommodate the dies. Cards plainly marked with all particulars are fastened at the various shelves, so that the workman knows at once where to go for a die, and what it is for. We cannot here refrain from remarking that we have seen plants where this idea could be carried out to good advantage.

At the side of each press, is either a suitable tray on which is placed the work for the operator, or a wheeled truck if such a tray is not practical. The trays mentioned can be seen in several of the photographs illustrating this article.

FIG. 10—IT IS ALMOST IMPOSSIBLE TO GET HURT WITH THIS MACHINE.

FIG. 2—A NOVEL SAFETY SCHEME, WHERE THE TABLE COMES OUT FROM UNDER THE PUNCH, FOR LOADING PURPOSES.

A part of the equipment on each press is a air hose which always has sufficient air pressure on it to blow away dust or small portions of tin which would have a tendency to stick on the die.

Should a larger portion stick to the punch or die, a skillet is provided on each press to knock away such obstructions.

This skillet, which is a large tapered piece of hard wood, is fastened to the side of press by means of a chain. The chain can be seen on several of the photographs. Of course, there is no possibility of losing the skillet when it is fastened in such a manner. Above all, the operators are warned not to place their hands under the punch.

On the ram of each press is fastened a set of safety rules, one of which covers the above-mentioned point. These

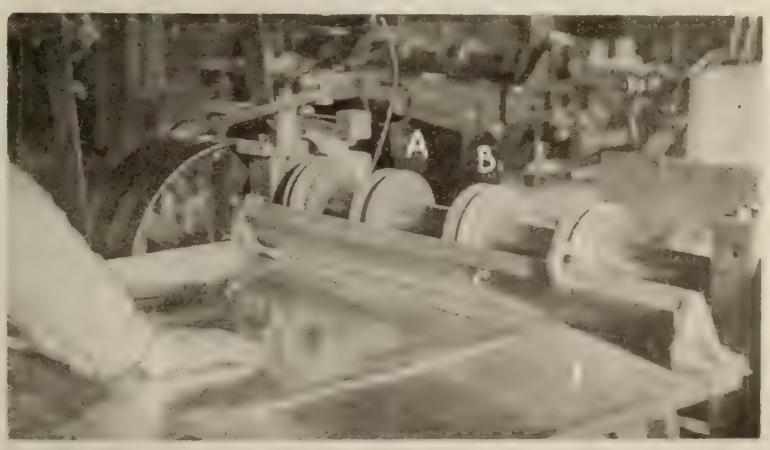

FIG. 11—A VERY EFFECTIVE TIN STOCK CUTTER GUARD.

rules are so important that we publish them in panel form.

Brief Description of Devices

Following we give a brief description of each of these devices, also below every photograph we mention the vital points in its favor.

In Fig. 1 we illustrate what the workers have nicknamed "The Flying Dutchman," and what we would call about as perfect a safety device as could be wished for.

It will be seen that the operator is quite a distance away from the press, which is continuous in its action, therefore in no danger. The automatic chute feed A, is merely a guide slide which sends down one piece at a time. The operation being performed is that of a bumping operation, the work being the tops of the well-known Dutch cleanser tin.

The tops are placed on the travelling chain B, out of the tray C, and a continuous feed is kept up. The die embosses, rolls the edge and bumps the perforations on this can top, all in one stroke of the press.

This installation has not only safeguarded the operator, but has increased production to a considerable extent.

At Fig. 2 we give readers a good idea of how the disked fly-wheel appears to the eye. As we have already mentioned the advantages of this system, we will go on to Fig. 3, which illustrates a very simple but effective cage guard used on a press punching milk can plug.

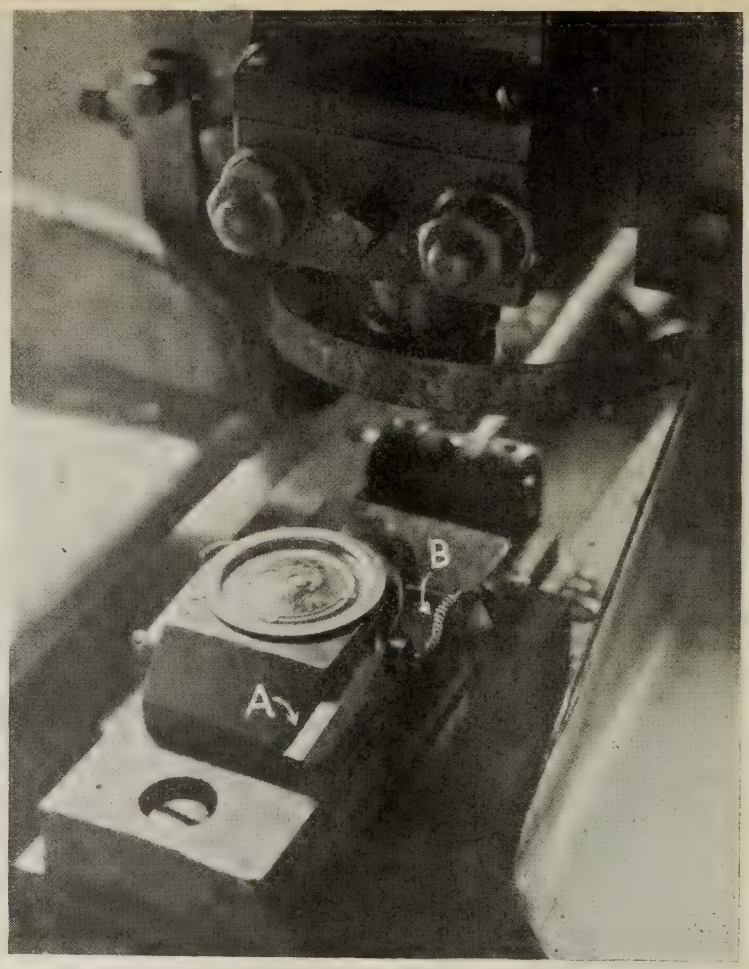

FIG. 7—A CLOSE UP VIEW OF THE STRIPPING MECHANISM DESCRIBED IN ARTICLE, RELATIVE TO THIS DEVICE.

FIG. 8—PRESS EQUIPPED WITH AUTOMATIC FEED SLIDE.

It is impossible to get your hand under the guard, and, of course, there is no need for you to stick your hand over it. The stock used is single width, and feeds in sidewise, as usual. The operator is never in danger, as the guard is so close to the die that it is impossible for anything thicker than the stock to pass through. 40,000 of these plugs have been turned out every nine hours since the installation of this guard.

Figs. 4 and 5 illustrate two more efficient safeguards. The former is simply a wire cage which completely surrounds the die, the work being slid down a small chute on to the die. In this operation, which is the punching of milk can plugs, two punchings are made at one time, the die being of double design. These punchings are made entirely from recovery stock, (i.e.) stock which has been recovered or salvaged from former operations. Considerable saving is thus effected.

Fig. 5 illustrates the chute principle in a more distinct form, the operation being the bumping and flattening of Crisco can tops. Production has increased since this guard has been placed on the press, and, of course, the operation is now free from danger. The operator's hand placing the tops in place in chute is clearly seen.

At Fig. 6 is shown what the workers call the "Go way—come back" press.

In a way this is not a bad name for it, for that is exactly what it does. The table A, on which the work goes, moves in under the punch immediately the treadle is depressed. Down comes the punch and performs the operation and out comes the table A, once more for the operator to remove the finished product, and to replace another piece in perfect safety. The action of this table is controlled directly through an arm from the crank shaft, with suitable lever and spring. A cam on the crank shaft pushes this table in and out, as the ram of press descends and ascends.

Before this method was adopted, six to seven thousand was the maximum production of can tops, with considerable danger attached to the operation, but at present nine thousand can be turned out in similar time with perfect safety.

Readers will also notice the guard B, which has a transparent front, in order to allow the operator to see clearly the action of the punch.

At Fig. 7 we show another installation of the "Go way—come back" motion, with yet another added feature. Readers will note the small lever A, with small spring B, behind it. Immediately the operation is performed the work table returns as usual, but in this case this lever kicks, or trips, ejecting the work automatically and throwing it into a chute which carries it into the waiting truck. By this method, the operator need only concern herself with the loading process, as the unloading or stripping of work takes care of itself.

We now come to Fig. 8, which illustrates an automatic feed slide A. It will be seen that the operator is so far removed from the punch as to be in no danger. To make sure that no punchings stick in the die, a swinging apron, B, is also installed as part of the die. This apron is made in two halves, swinging from stud C, as a fulcrum, and a similar stud on the other side of the die. The operation being performed is what is known as a friction plug. Briefly, the action is as follows: The ram descends, the apron B opens, being opened by the pin D, which goes through a hole in the apron. A similar pin on the other side opens other half of the apron. The portion E trips the lever F, and feeds down the work at the proper time. The operation being performed, the ram, with punch, ascends, the apron closing automatically, the punching drops on the apron and slides into the chute G, and from there into the receiving box or truck.

The previous production before this safeguard was installed was 2,500 per hour, but 3,000 per hour is now turned out with the operator's safety assured.

We call the readers' special attention to Fig. 9, as here is shown the latest safeguard of all. This guard, A, is used in conjunction with what is known as a 5-step gauge, B.

A study of its action will be time well spent. The stock is first of all cut off in five widths, that is, sufficient stock for five rows of punchings. Readers will, by looking at this photo, notice four different gauge points, C, D, E, and F.

These handle quickly four different positions of the stock. The fifth position, which, in reality is the second row of punchings made, is controlled by the finger gauge G, which is operated by the heel of the operator's hand on the lever H. On the other row of punchings being made it is necessary that this finger gauge be lifted out of the way. This is accomplished by means of the pin J, supported from the bracket K. Every stroke of the ram the spring clip M comes down on this pin J and trips finger-gauge G, lifting it sufficiently to allow the stock to pass through. The action of depressing the lever H allows the finger-gauge to remain in place to gauge the stock on the second row of punchings. Readers will, of course, easily grasp the construction of the guard A, as it is merely a well-constructed cage with a plate glass front to enable operator to watch closely the operation.

Fig. 10 illustrates an altogether different type of machine, but a safeguard of splendid design. The operation to be performed is that of trimming and beading the bottoms of shoe blacking boxes. The work is fed into the chute A, the wheel B allowing but one piece to go through at a time. The operation itself is performed down towards the bottom of this photograph, so that the operator

SAFETY RULES

1. Do not operate this machine until you have been shown how to run it.
2. Do not operate any machine in this factory until ordered to do so.
3. Never place your fingers under a punch or knife, or between dies or rolls of any machine.
4. Use a stick or hook to remove pieces of work, dirt, etc., from dies or any other part of machine. If no stick or hook is handy ask the foreman for one.
5. If machine gets out of order stop it and tell foreman. Do not start it again until it has been fixed.
6. Never clean machine while it is running.
7. These rules are for your safety, and must be obeyed.

(Signed) AMERICAN CAN CO.

NOTE.—A set of these rules is printed on a tin panel and fastened to the ram of every press in the plant.

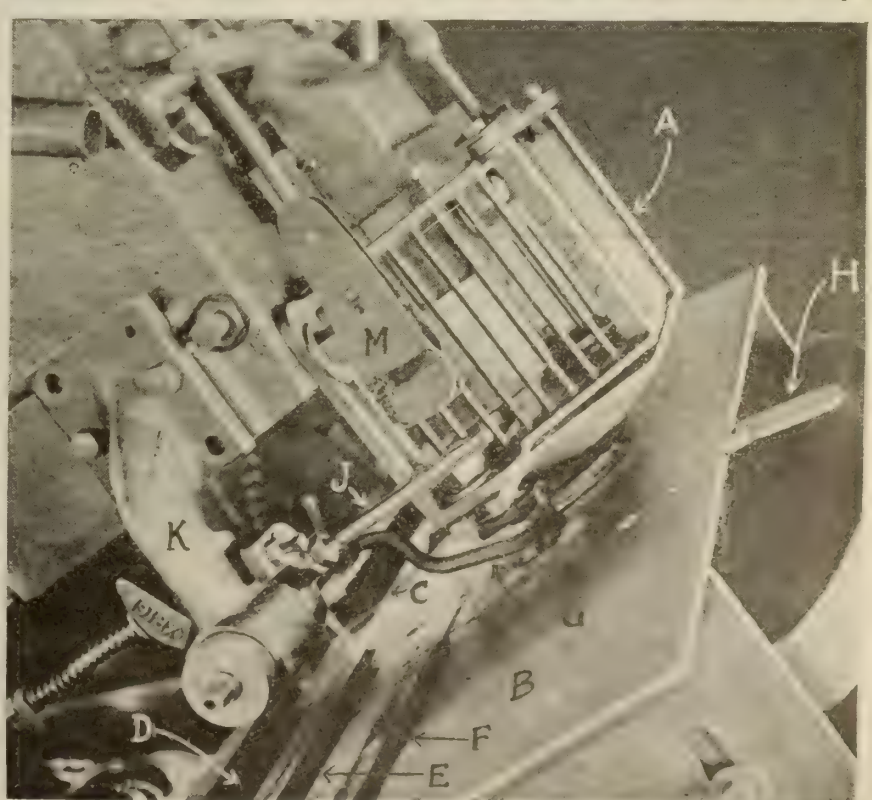

FIG. 9—A NEW DEVICE, COMBINING SAFETY AND EFFICIENCY, KNOWN AS A FIVE-STEP GAUGE.

is never near the scene of action, therefore in no danger.

Last but not least, we come to a very simple gauge (shown at Fig. 11) and yet one which has prevented many an accident. The operation is cutting the wide stock tin to various widths.

The wheels A, B, etc., accomplish this operation. Formerly it was a common slip, and, although not actually taking off his hand, these wheels or cutters used to give him a nasty wound.

But now conditions are different, with practically no added expense to speak of. A simple cast iron guard C is fastened on to the bed of the machine as shown, and the operator cannot possibly get his hand near these cutters except he deliberately takes his hand off the stock and sticks it over on to the revolving wheels. Of course when a man does this sort of thing he needs a doctor in more ways than one.

Having studied the various safeguards, let us see what conclusion we can arrive at. For instance: **Does it pay to instal safety devices,** both from the employers' point of view and from the employees' standpoint? We would say **Yes** with a capital Y, for not only is the employee protected, but the employer gets added production, with the knowledge also that he is, as far as humanly possible, looking to the welfare of his workers.

"Has it paid the firm referred to to instal these devices?" might be another question we could ask.

Again we say yes emphatically, for although this firm has appropriated over $188,000 (throughout all their plants) on safety devices of all kinds, they consider it money well spent.

Against a record of numerous accidents of all kinds, the firm have only two accidents to tell of this year, each of which could easily have been avoided with a little care on the part of the operators.

It will be noted throughout this article that production figures on all operations show an increase instead of a decrease, as some people would have you believe always happens when a safety device is installed. Such an impression is erroneous in every respect, for it stands to reason that the worker feeling perfectly safe can enter into her work with more speed and zest than before.

As the great percentage of press operators in this plant are girls, still greater credit is due to the management, in that they have reduced accidents to a minimum In conclusion, we can only express the hope that readers will find at least one idea in the present article which they can adopt in their own line of business.

Above all, boost the safety movement. Remember the three rules of safety: **First, look; second, look again, and third, look once more.** If you do this you will never regret it.

Making Steel in Canada

The Open Hearth and Bessemer Processes Are Described in This the Last Portion of the Series. The Acid Open Hearth and the Basic Open Hearth Processes Are Discussed in Detail

IN the early days of the iron and steel industry the product of the blast furnace known as pig iron, was converted by means of a puddling furnace into wrought iron. The furnace in which this conversion took place is shown in Fig. 1. In most cases it was fired by coal, although in some progressive plants gas was used.

The iron made in these furnaces was made as the result of very severe physical exertion on the part of the workman—the quality of the material depended upon both the workman's mental and physical powers. The furnace held five or six hundred pounds of metal, this metal was subjected to the influence of the heat and air from blowers until it reached a semi-liquid condition, and then by means of an iron rod, called a fettling bar, the operator worked up balls of semi-plastic material, weighing about one hundred pounds each. The balls were removed and taken either to a hammer, or a set of rolls, and worked into bars. They were known as puddle bars, and formed the basis of all other rolled and forged materials. The theory at the back of the puddling furnace is a little hard to understand, but the impurities were removed by oxidization, and the working of the material in the bath exposed all portions to the action of the flame, and resulted in a material tough and fibrous. The drawback, of course, was that only small quantities could be made at a time, and that a dependable analysis was hard to obtain.

This product, as mentioned before, was known as iron. Steel was made by taking selected pieces of iron, packing them in a crucible along with certain materials high in carbon, and bringing the whole to a soaking heat for a certain period. This produced a material that could be used for the purpose of making cutting tools, knives, etc.

After the discovery in year 1856, by Sir Henry Bessemer, that steel could be made in larger quantities, definitions have changed, and steel can now be defined as "Purified pig iron, which has been cast while in a molten state, and in which the carbon and other impurities present in the original pig iron have been reduced to such a point that the ingot cast is capable of being forged, or rolled into blooms, slabs, billets or bars."

To day we have four (4) main branches of the iron family:

Cast iron, which contains anything from two and one half (2½) to three and one half (3½) per cent. carbon, and is the product of the blast furnace without any refining, except remelting.

Steel which has been defined

above, and for usual commercial purposes, such as structural steel bars, etc., has a carbon content of from .20 to .50 per cent. carbon.

Steel castings, or cast steel, which is a material very much the same as the steel mentioned above, except that it is cast into a mould, and intricate and massive shapes obtained, which cannot be manufactured by rolling.

Tool steel and alloys steel made by melting either in an electric or a crucible furnace, selected portions of bar steel with special chemical ingredients to obtain an extremely hard material capable of cutting and working other steels.

All the above are known as ferrous materials, ferrus being the Latin name for iron, and they are thus distinguished from the non-ferrous materials having copper, etc., as a base.

We have already mentioned Sir Henry Bessemer, who in year 1856 made known what was then called the method of making steel without fuel. The apparatus he used is that known as the Bessemer convertor. Roughly, the process consists of placing a quantity of molten iron in a vessel; air is then introduced at the bottom and blown through the bath of metal. The rapid combustion that ensues eliminates carbon and other impurities, and the working of the bath secures a thoroughly mixed material.

The shape of the vessel is very peculiar. It is suspended by trunnions between two high "A" frames, the air entering through one of the trunnions and being carried down to the wind box at the bottom. The wind box contains the bottom section in which are a number of small holes, 3/8 to 5/8 inch. in diameter, through which the air is forced into the molten metal. The bottom portion is made removable and special facilities are usually provided to enable bottoms to be changed without loss of time; their average life is from twelve to twenty operations, or blows, as they are termed. The other trunnion is used for attaching the necessary gearing for rotating the vessel, and the peculiar shape of the nose-piece is to enable the molten metal to be poured in when the vessel is laying in a horizontal position. The vessel is lined with firebrick, laid

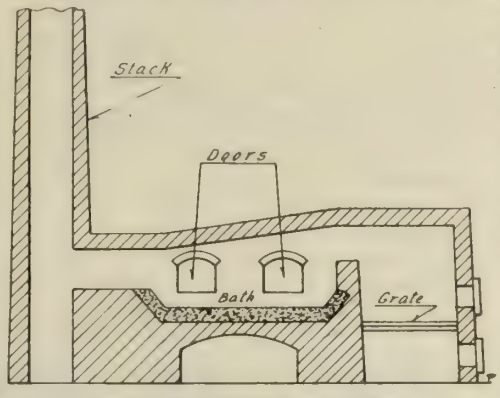

FIG. 1—PUDDLING FURNACE.

with great care, a lining may last from six hundred to one thousand blows.

The actual time to blow a charge of metal is about twenty minutes, but charging and pouring consume, perhaps, another thirty minutes, so that one blow per hour is all that can be counted on. Modern convertors usually have a capacity of from fifteen to twenty tons.

The metal is brought from the blast furnace in the hot metal ladle. The ladle is lifted up and the contents either poured direct, or by means of runners into the convertor, the blast is then turned on and the vessel turned to the vertical position. After blowing, the vessel is again rotated and the contents are poured into other ladles, and from this thence into ingot moulds. The blast is supplied by a blowing engine, or turbine, and has a pressure of from twenty to twenty-five pounds per square inch.

This invention of Sir Henry Bessemer marked an epoch in the history of steel making, for by it large quantities of steel could be produced at a time, but owing to the rapidity of the process the analysis of the material was not completely under control. It is quite true that practically all the carbon could be removed, and carbon in one form or another added in certain weights to give the desired results, but the other ingredients, such as manganese, silica, sulphur and phosphorus were not under complete control, and Bessemer steel lacked the uniformity that afterwards came to be desired, so a process known as "The Open Hearth Process" was perfected by Sir William Siemens about the year 1861. Fig. 2 shows a cross-section of an open hearth furnace, and before proceeding further we should become acquainted with the particular parts:

Furnace Proper. Note the heavy steel binding, and the manner in which the furnace can be rotated in order to pour the metal, and skim off the slag.

The Port Ends. The lower opening is for the gas, and the upper opening for the air. Combustion, of course, does not take place until the two intermingle in the furnace.

The Checkers. A mass of brickwork arranged with openings somewhat similar to the checker-work in a blast furnace stove. One checker is for heating the gas, and the other for heating the air.

The Stack, which provides the draft for pulling the gas through the furnace.

The Gas Inlet Valve.

The Air Inlet Valve.

Now, follow a complete cycle of operations, the gas and air come in through their respective valves, which are so set as to enable them to pass along the flues, through the checkers, up through the ports and into the furnace; they mingle and ignite, pass over the bath of metal in the furnace, out through the ports on the opposite end of furnace, down through the checkers,

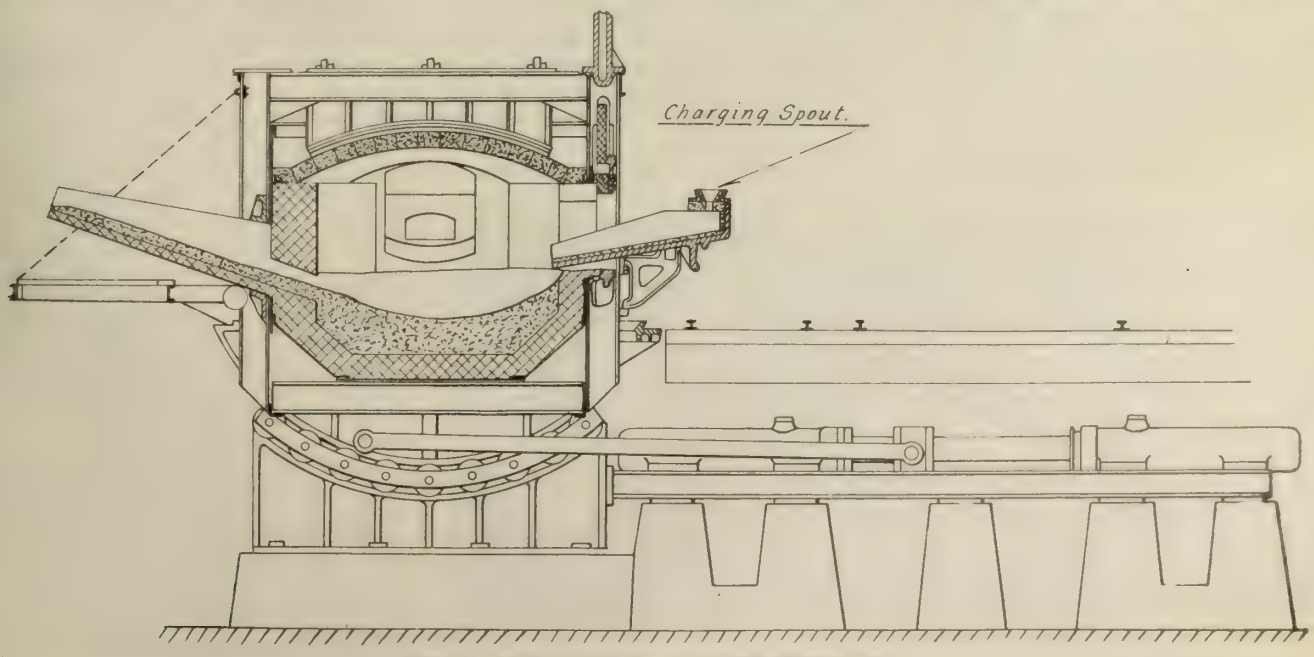

FIG. 2—CROSS SECTION OF 25-TON FURNACE.

giving up their heat as they pass to the brickwork, through suitable openings in the gas and air valve into the flue and out of the stack. After operating in this manner for, say, twenty minutes, the valves are reversed and the gas and air take exactly the opposite path. When a furnace gets properly into operations, the air is pre-heated to a temperature of about one thousand degrees by the heated brickwork of the checkers. This process of obtaining heat from the waste gases is known as the regenerative process.

Not all furnaces are made of the tilting type. Many are stationary, and have a tap hole opened very much the same as a blast furnace. The brickwork forming the end of the ports is contained in a cage and made removable, so if the end of, what might be termed, the blow pipe becomes burned away, it can be replaced without stopping operations for a lengthy period.

Steel made by this process is, of course, known as open hearth steel, and the usual period to refine a charge of metal is from ten to twelve hours. At any time samples may be taken and analyzed, so that the metal is under complete control of the melter. Capacity of the furnaces varies from ty-five to one hundred tons.

There are two distinct open hearth processes: the acid open hearth process and the basic open hearth process. The furnaces, port ends, checkers, etc., are the same for both processes, except for a difference in the material forming the furnace bottom lining.

The different processes are to suit ores of varying qualities. Let us review the impurities in the raw materials:

1.—Carbon—which settles the class and strength of the steel.

2.—Silicon—desirable in correct proportions.

3.—Manganese—desirable in correct proportions.

4.—Sulphur—produces red shortness.

5.—Phosphorus—produces cold shortness.

The acid process takes care of low phosphorus and sulphur ores, while the basic process takes care of high phosphorus and high sulphur ores.

The Acid Process

The acid process aims at reducing to allowable limits the following impurities in the steel:

1—Carbon.
2—Silicon.
3—Manganese.

The sulphur and phosphorus is not eliminated, so the total furnace charge must not contain more of these constituents than is desired in the finished heat.

The process is one of oxidation, or burning, the carbon in the steel is oxidized to carbon monoxide, which further changes to carbon dioxide and passes off as a gas. The silicon and manganese are oxidized and form the slag that floats on top of the bath of metal and protects it.

The Basic Process

The basic process aims at reducing to allowable limits:

1—Carbon.
2—Silicon.
3—Manganese.
4.—Sulphur.
5.—Phosphorus.

The first three items are removed in the manner described in the acid process, while the sulphur and phosphorus are removed by the addition of lime, which forms a slag to absorb them.

The charge of a furnace consists of hot metal, scrap and lime. The metal is poured in by means of a charging spout. The lime and scrap are charged by means of a charging machine, Fig. 3. This machine picks up a steel box full of scrap or lime, takes it to one of the furnace doors, pushes the box into the furnace, turns it over, dumping the contents and then withdraws.

When the heat is ready, samples having been taken and quick analysis made to determine the pouring, the ladle is placed before the furnace, the melter takes his position and with a signal orders the huge furnace to be slowly rotated, the silver stream of liquid steel breaks away from the bath, rushes along the pouring spout and plunges into the ladle.

The analysis of the metal is known, and the melter also knows what class of steel is desired, swift calculation is made and carbon in the shape of powdered coke, or coal added to correct; also manganese in various forms.

The ladle fills, the slag overflows and is caught in a pit or another ladle, then the crane hoists the 75 or 90-ton load and places the ladle over the waiting row of ingot moulds, the opening at the bottom is opened and the steel flows out and fills the moulds.

The moulds are all on cars, and after cooling are taken to the stripping crane, where the mould is lifted off and the ingot is then ready for the mills. See Fig. IV.

Before passing on there are one or two details deserving attention. The reversing valve, Fig. V, notice how the direction of the gas is reversed and the path of the waste gases altered by the one movement.

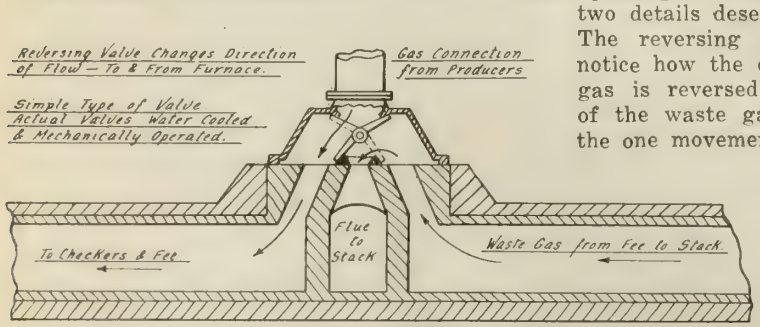

FIG. 5—GAS REVERSING VALE.

The pouring nozzle in the ladle, Fig. VII, which enables the metal to be poured from the bottom of ladle into the moulds.

In some plants the metal from the blast furnaces is taken first to a mixer,

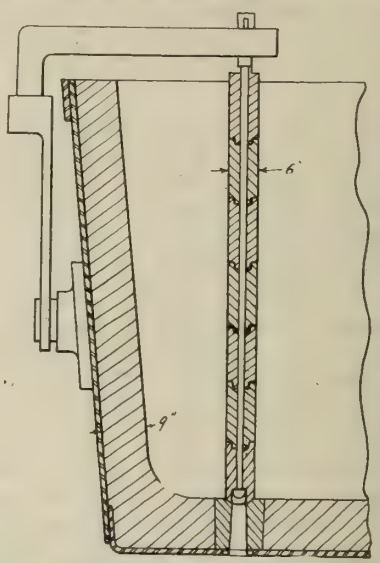

FIG. 7—SECTION OF A PRODUCER.

which acts as a reservoir and secures uniformity of product.

The usual fuel for open hearth furnaces is producer gas, made from bituminous coal, but coke oven gas and tar are sometimes used.

The gas producer is an appartus for producing combustible gas by the incomplete combustion of solid fuel.

Fig. VIII shows a section of a producer manufactured by the Morgan Construction Company. The operation of making gas is as follows:

When the producer is in operation, the layer of ashes extend to a height of about three feet above the ash-pan, or to such a point that the top layer of ashes is kept opposite the sight-holes in the producer shell. The central blast tuyere is, therefore, surrounded by ash and protected from the heat.

A horizontal layer of incandescent coal from 2 ft. to 3 ft. thick commences at the level of the sight-holes. At this point the red-hot carbon, coming in contact with air and steam which have been superheated by passing through the glowing ashes, seizes the oxygen from both and is transformed into carbonic acid (CO_2), at the same time liberating the hydrogen from the steam. The carbonic acid passing upward seizes another atom of carbon from the hot fuel, forming carbonic oxide (or carbon monoxide CO), while part of the hydrogen from the steam will also unite with the glowing carbon, forming marsh gas (CH_4) or other hydrocarbons. In the upper layers of the coal a somewhat lower temperature prevails, but even at the surface of the fuel the heat is sufficient to liberate the rich volatile gases which are found in varying percentages in all bituminous coals.

To melt a ton of steel takes about

Continued on Page 84

How One Galt Concern is Forging Ahead

Herein is Described the Plant of the Elliott & Whitehall Co. This Concern, Though Only Established Two Years, is Handling in Splendid Shape Some Very Important Work

By J. H. M.

IF you were to select say ten parties and ask them how long, in their opinion, a concern should be in existence to become established, the answers would be without doubt varied. This question of existence and establishment carries a greater problem than appears on the surface, for conditions, not only of trade, but of location, labor, etc., enter into the matter very strongly.

We do not intend this article to be an attempt to prove that two years' existence means establishment, but we do wish to place on record that here is a firm only a few years of age, so to speak, and yet very well established and running night and day.

To reach this result in such a short space of time, needed perseverance, ingenuity and hard work, coupled with a firm belief that success would come in due course of time, but these are characteristics that both members of this firm possess.

Their plant is filled with all the latest type of machines, such as Cisco Tool Room Lathes, LeBlonds, Turret Lathes, LeBlond Universal Milling Machines, McKenzie Shapers, Oakley Grinders, Rivet Internal Grinders, and a variety of special machines for the tool room department, etc., and owing to the daily repeated orders from the largest manufacturers in Canada, this young concern will soon be branching out into larger quarters to make it possible to keep their promises on deliveries on their work.

The class of work tackled by them is varied to say the least, for while their regular line is milling cutters and small tools, they also handle special machinery such as jigs and fixtures, metal stamping dies, etc.

The photos throughout this article illustrate some of their machines in actual operation and in addition to the regular equipment, they are building at the present time a special saw grinder from which they expect good results. This is the firm's own scheme and will aid greatly in their production.

The heat treating portion of the plant is well looked after, three units built by the Standard Fuel Engineering Co. of Detroit being used, a carbon steel furnace, a high speed furnace and oil tempering furnace being installed. The oil quenching bath is enclosed in a water cooling arrangement which ensures fresh water at all times, keeping the oil at proper temperature. Work of all kinds including carbonizing is easily done with these heat treating units.

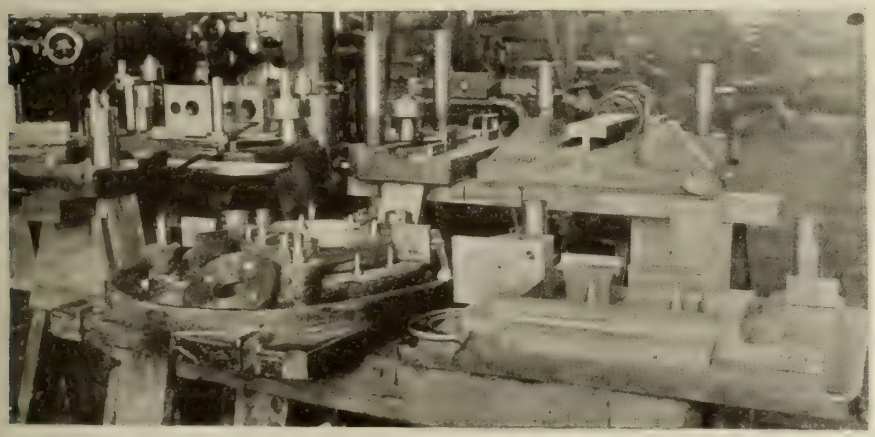

FIG. 1—GENERAL VIEW OF VARIOUS DIES MADE AT THIS PLANT.

If you look at Fig. 1, you will see various types of dies, etc., made by this firm. No attempt has been made to show any particular die, but rather to show a general view of the different kinds, and Fig. 2 shows a portion of the plant operating these dies.

While the next portion of our story may not be strictly mechanical, yet it's worth the telling, for at the present time everyone is talking Victory Loan and Victory bonds.

This firm was the first concern in their city to be awarded the Prince of Wales emblem for obtaining 100 per cent. in this new loan campaign. In addition to this honor, seven crowns have been awarded them for exceeding the allotment in the amount of the subscriptions. The flag is now proudly floating over their plant. Pep, vim, and enthusiasm make such conditions possible.

One thing more and we are through for the present. Every employee is a reader of CANADIAN MACHINERY. We mention this with justifiable pride, for while we would not go as far as to state that we are, by our paper, helping them along, still it shows that their success is due to initative together with employing of men of ambitious nature, who are anxious to keep up to date, and therefore read CANADIAN MACHINERY.

Car Company Reorganization.—Reorganization of the National Steel Car Company will be considered at a meeting of the shareholders to be held shortly. A circular has been issued showing accounts payable of $3,487,740, and accounts receivable and inventory, $1,884,556, leaving a deficit of $1,603,184. The company has adjustments under negotiation with the P. L. M. Railway in France, which would result on the company receiving $450,000, and its real estate, plant and machinery are valued at $2,600,000. The reorganization proposed calls for a new company, 19,000 shares of the stock of which would go to the shareholders of the National Steel Car Co., the latter also receiving the proceeds of the French settlement.

FIG. 2—GENERAL VIEW OF THE MACHINE SHOP.

Solving the Problem of Why is a Hot Box

Excerpts From a Paper Read Before the Canadian Railway Club, of Montreal, at Their September Meeting, on the Subject Above Mentioned. The Discussion of Same is Also Reported

"Why Is a Hot Box?"

Mr. President and Members.—The query offered you in this little paper strongly reminds us that a person of inferior intellect may advance a proposition that a sage may find difficult of solution. In other words, a fool may ask a question a wise man cannot answer. If you will accept the part of wisdom and look for the answer, I will bear the onus of the simple, but inquiring mind.

The expression "Hot Box" is the one generally used to describe that condition which results from the journal of a car truck becoming heated.

This heating of the journal has a wide effect. It first sets fire to the waste and oil in the journal box, then it warms up the temper of the brakemen, this is transmitted to the conductor, and from him to the engineer. The next to hear of it is the dispatcher and he becomes hot. Then the trainmaster comes in on the game and he heats up the superintendent and the car department. If there is sufficient fire it gets up to the president at times and great is the "Passing of the Buck" all along the line.

The only one vitally interested who keeps cool seems to be the car knocker, who puts in the new brass and dope, which costs the railway anywhere from 5 to 8 dollars. He seems to be a fatalist and regards the matter as an act of God, against which it would be futile for him to rage, or get hot.

I used the expression "Passing of the Buck" in this connection, and as I am afraid some of you may not know what I mean by that, I will explain that it is merely that regular routine of our daily life wherein you attempt to get from under, and put it on the other fellow, regardless of the merits of the case.

In dealing with hot boxes, the "Buck" is a lively animal, as he has a wide field to cover, but one thing we do know and that is that we are further away from a solution of the problem to-day than we were 25 years ago.

Some young men of a serious turn of mind will no doubt resent me treating this matter in a semi-humorous manner. Well, you see we get that habit of late years. The boys at the front, you know, went out after the Hun with a joke, but he knew how deadly the thing was just the same. We at home joke about the high cost of living and other serious things, while we wear our year before last underwear and get that old suit turned wrong side out for twelve dollars because we can't pay twenty dollars for a new suit, and pay for a bond at the same time.

I really am not disposed to treat the hot box in a light manner. It is far too important for that. It means huge sums of money and danger to life and limb of the railroad man and the traveling public. Nor am I disposed to give that lively animal the "Buck" any more exercise than I can help in dealing with this matter.

There is no effect without a cause, and behind everything is a fundamental principle. The cause in the case of the hot box is 99 per cent. neglect—the effect is bad.

The first thought in the minds of some of you is to jump up and protest that word neglect, but wait awhile and see how it turns out. In dealing with hot boxes you will find the "Buck" turn up under many aliases—a few of them are: Bad oil, bad waste, bad brass, rough journal, rough truck, truck out of square, overload, etc. Each and every one of these spells "neglect" by someone.

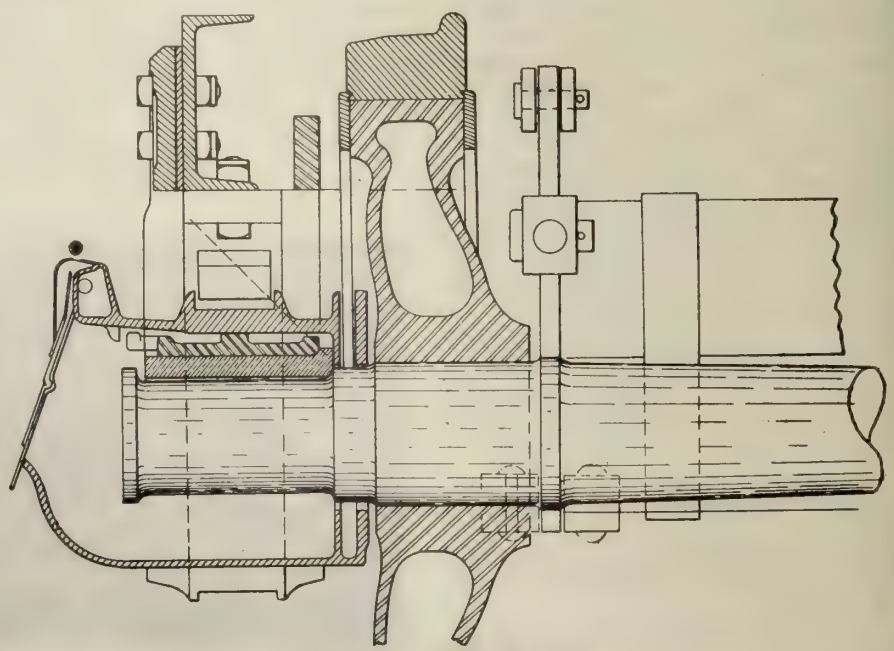
A car truck mechanically correct requires very little lubrication to keep it running with cool journals. By mechanically correct we mean that the truck has been properly constructed to do the work it was intended it should do. The journals on which it rides are of a size to carry the load they will be called on to carry, the saddle, or wedge, of proper shape and the journal bearing of a quality of metal that will reduce friction to a minimum.

If we start out with such a condition, and maintain it, the question of lubrication is so simple that it is practically non-existent, or it would be if the conditions surrounding the working of a car truck were not so diversified.

Now let us glance at a concrete example. We will take a train load of grain from the West, or the lake ports. The cars are, when loaded, in fair condition, not perfect, but fair. Some of them have new journals and wheels, some of them have old. Some new brasses and some part worn. This train starts out with a locomotive that leaves it at the end of 125 miles. The locomotive is carefully looked over by the engineer and then placed in round house where other men look it over and do any repairs necessary, and it starts out on its next 125 mile run in pretty good order. At least it has had a good deal of attention paid to it.

What about the cars? They are run onto a siding and two car men start down the line to inspect the boxes. How do they do it? They pull off the box cover, glance at the end of the packing in sight, see that there is no smoke, close the lid and go on. The engineer when going around his engine, places his hand on the big end, the little end, the slide bars and many other parts to note how cool or warm they may be. He knows they are not hot, but he wants to know if they are thinking of becoming hot. Does the car man do this? He does not, and the cars start out on another 125 mile run. How many hot journals are there at the end of that run? We don't know, maybe one or six. These receive attention of a kind at this stop, and on they go again.

Before they reach the end of the next



SECTIONAL VIEW OF BOX.

run some of those that were hot have had several brasses applied to them with more or less success. Some of them are in bad shape and must be stopped for new wheels, the journals have been cut, and some that did not give trouble at the first or second stop are giving trouble now, and so it goes on to the end of the run. Now, if these journals had all been tested with the hand at the first stop and those showing an inclination to heat given a little attention, and the same thing done as often as the engineer tested his engine, do you believe there would have been so many hot boxes on that train?

Did any of you gentlemen ever use a horse and buggy and suddenly find one of the wheels sliding and jump out and grab the nut with your fingers, and let it go again quick, because it was hot, and after it had cooled off and you removed the wheel you found plenty of oil on the journals, with the exception of a spot about half an inch wide? I have, and it made me realize that it is not necessary for a journal to be all dry to make it run hot. It is the back end of the car journal that needs attention, but how seldom it gets it until too late.

Do you agree that the hot boxes on the train we have tried to describe were due to neglect, and was that a fair skeleton description of the average train? Well, then was not it neglect to give the necessary attention that was the cause of 99 per cent. of the hot boxes. Why this neglect? Here is one reason, the railroads haul freight at so low a figure that they feel they cannot afford to have the number of men necessary to give the cars the proper attention. What you can't do yourself you must trust in Providence for, and Providence does not look after box cars.

Just here I wish to say that, in my humble opinion the men who design our cars and the men who maintain them come very near performing a miracle in keeping the number of hot boxes so low, considering the adverse conditions under which these cars must operate.

There are many other phases of this question apart from the above, and there is one that is most difficult to deal with. This is the car left at a way station or siding in winter time until the dope is completely frozen, but the car is thrown onto a train and must get along as best it can. However, the better attention at divisional points hinted at above would help greatly in these cases. We cannot, I believe, totally eliminate the hot box on freight cars, but we can reduce the number 75 per cent. by spending the money to do it.

The foregoing few words will, I hope, introduce the subject of hot boxes on freight cars, but we still have the question of the same trouble on our passenger equipment.

Some time ago I had the pleasure of looking into this matter and after taking the statements of trainmen, trainmasters, superintendents, car men and others into account, and also watching the "Passing of the Buck" along the line, I came to the conclusion that here again we come down to that word neglect.

In a Canadian winter our cars do have a hard time of it. Shoved into a yard with snow and ice scraping the journal boxes, with the inside heated to 100 degrees and the outside frozen solid, they cannot be in good condition to give satisfactory service. The only answer to that problem is to have the cars placed in a building as engines are placed in round houses. Such a building should be heated to about sixty degrees and no heat applied to inside of cars. Two hours after cars are placed in such a building all snow and ice falls away from trucks and running gear, leaving the car clean for proper inspection. The dope remains in the best possible condition, and the car goes out for its run in as good shape as we can make it. I have seen cars handled in this way, and I know that the results were good.

Many people will say that it is impossible to house all of our passenger equipment, or not actually impossible, but that the cost would be prohibitive. I fully appreciate the fact that the cost would be great, that is the initial cost, but it is a question if it would not be quite as wise an investment as the round house. It would not be necessary to place every passenger car, mail car and baggage car inside of a building. Many of the spare cars could be left outside as now, but I believe that we should have buildings to accommodate all cars on our regular trains with room for a reasonable number of spare cars that should be available in case of accidents.

The cost of such buildings would be considerable, but against this cost, what would we save? I believe that this building could be heated with less fuel than is now used for keeping the interior of cars warm while standing out of doors, and that the number of hot boxes could be greatly reduced, or practically eliminated. It is hard to tell just what a hot box would cost, but we know that they cost considerable money. I also have statements from car men to the effect that in one year they have expended sufficient money in re-piping cars that have been frozen to pay for a building to protect them. This may be exaggerating, but if the saving in this direction in five years would pay for the building, I believe it would be a good investment.

There is another phase of this question that in my opinion has not received the attention that it deserves, and that is the extent to which we are using, by wear, our journal bearings. I have made several tests of this, and have found that the quantity of brass actually used up by wear is very small indeed. We are practically running on white metal. This does not apply to any particular road, but to many roads, as I have reports from different places on the continent all bearing out what I have said.

Now, what is the trouble here? I think we can all remember when journal bearings were very much more worn in service than they are to-day. I can remember journal bearings that had never given trouble and were finally removed because they were worn so thin that there was fear of them breaking or being worn clean through, allowing the journal to come in contact with the wedge. Such a condition, so far as I know, is practically unknown to-day. It may be stated that in the days when journal bearings were so worn that our cars and loads were lighter, and this is true, but in those days our journal and journal bearings were smaller. In other words, they were designed to carry the loads of that day. The journals and journal bearings in use to-day are supposed to be designed to carry the loads of to-day. They are not doing it in a satisfactory manner. Is this another case of neglect, that is, have we neglected to provide journals and bearings large enough to carry the loads?

I believe that these matters are of vital importance and they deserve all of the attention we can give them, and that any man who has an idea on the subject should feel at liberty to advance that idea. He may be wrong, as I may be in some of my ideas, but by advancing his proposition or idea he may bring out a better one, and that is what we want.

This little paper has been purposely made short. The idea being that it would merely introduce this very important subject, and I have endeavored to interest not only transportation and mechanical people, but also members of the Engineering Department, and have these people present to take part in the discussion. There are many angles to this matter, and one of these is the engineering angle, which I have not touched on at all.

In conclusion, I want to say this, this club has been in existence a good many years, that it has done some good I know, but I honestly believe that if the club will take up this question of hot boxes, and follow it through, and have their work result in the elimination of 75 per cent. of the hot box trouble of this country, it will have done a greater work than anything that it has done in its previous history.

Chairman:

Gentlemen, I think you will all agree with me that this is a very interesting paper and should bring out a lot of discussion. I would like to hear from any gentleman pertaining to this valuable paper.

In a discussion that invariably follows the reading of paper of this description there are generally many reminiscences mentioned that have no direct bearing on the subject, these incidents being cited to relieve the tension that might otherwise develop if the members confined their remarks exclusively to the points in question. Our readers will therefore bear with us if we omit such portions of the discussion

as might be considered of minor import, dealing only with the essential factors that treat on the subject of "Hot Boxes." While the discussion at this meeting was almost entirely one of interest to railroad men, the principle of the arguments could be readily applied to all classes of engine or machine bearings.

In opening the discussion, W. H. Rosevear, of the Independent Pneumatic Tool Co., who has been away from actual railway service for the past sixteen years, commented on the apparently slow progress that had been made in solving the problem of hot boxes. In part he said:

"Mr. McVeigh has touched on the difficulty of getting lubrication at the back end of the journal. I would suggest that each inspector be supplied with an X-ray machine, so that he can examine the lubrication at this part of the box, and see that it is acting as it should do. (Laughter). Another matter that struck me rather forcibly was Mr. McVeigh's reference to journal bearings equipped with white metal. From what I have heard on this question, I was led to believe that they are putting less babbitt in journal bearings, because they are getting a much better mixture of brass than they were formerly able to do. I remember some years ago a certain agent came to see us in an effort to obtain the contract for brasses for one thousand box cars that were to be built. We explained to him, of course, that the whole matter was in the hands of the purchasing agent, and he went to see him. Some time after he came back and said: "Well, I got that contract, but he cut me terribly." I replied that we would expect him to supply brasses in accordance with what we wanted, and he said, "I will supply them according to the price," and that is just what we got. Some of those cars had to have all their original brasses renewed before they reached our line. Another matter is the question of housing passenger equipment. We take care of our locomotives very thoroughly, but the rest of the rolling stock does not get the attention in this respect that it should. Why?"

At this point, C. L. Higgins recited an incident in which he had suffered a loss of several thousand dollars, due to delay caused by a hot box developing on a train upon which he was travelling. As a direct result of his experience, Mr. Higgins has spent considerable time in designing and constructing a device that he claims will practically eliminate the railroad hot box.

He demonstrated with an appliance consisting of a telegraphic relay, an electric bell, with batteries connected to two posts between which was a fusible link. He showed how this link would fuse when the temperature of a journal box reached 150 degrees and the broken circuit would result in operating an electric bell in the coach or sleeping car, which bell would ring until the box received attention. He further explained that a spring in the box could be released by the same operation which would drive a plate holding the packing and oil up against the journal, providing lubrication automatically.

In commenting on the subject of carelessness, C. J. Forrester, of the G. T. R. Car Department, remarked:

I think there is no appliance that is receiving more attention at the present time, but it must be remembered that when you start out with a passenger train that is running sixty miles an hour this means that the car journals are making 50 revolutions—this means that your journals have to do heavy duty and as soon as you get through the white metal you are down to the brass and the brass starts to give trouble. Forty to fifty per cent. of your trouble is due to starting out with new pairs of wheels, and I think that, all things considered—ten per cent. carelessness would be a better estimate. Another thing—in examining a freight train, an inspector will examine 200 or 300 journals per day. He cannot examine the back end of every journal nor see if the white metal is worn from the brass. I think if you examined your lists and saw all the white metal that was going in you would be surprised."

Owing to the abnormal conditions that existed during the war, when it was next to impossible to obtain and retain experienced men, the problems of railroad maintenance were surrounded with almost unsurmountable difficulties. In this connection, C. McNair, of the Galena Signal Oil Co., made the following statement:

"The conditions, during the last few years, railroads had to contend with were the worst ever experienced in regards to lubrication of their equipment. During the war there was a general shortage of railroad equipment and labor was at a premium. The United States Administration and the Canadian Railway War Board worked together, with one thought uppermost in mind, (win the war), did everything possible to keep cars moving, so much so that in many cases cars did not receive repairs which would have been considered necessary during normal times. Coupled with this, labor was so scarce that in many cases men were hired who were not efficient railroad workers, and as a last resort car foremen would give them jobs as oilers. Because they were called oilers and believing their work was pouring oil, they managed to get oil cans and poured oil in journal boxes until the wool waste became so wet and heavy that it lost its resiliency, settled away from the journals and in due time hot boxes were the result.

"Railroad employees in the United States received substantial increases in wages, and later same increases were put into effect on Canadian roads, but for some reason or other employees known as oilers are paid less than car repairers, therefore it is difficult to keep good men working as oilers. I would strongly recommend that these men be paid more than repairmen, because, in my opinion, they have the most important work in a car yard. In this connection I would also recommend that they be given a better or more important title than "oilers." They are deserving of a real fancy name.

"For years instructions were issued showing the proper method of packing boxes (and a great many of the roads endeavored to carry out these instructions) which explained that a roll of waste be formed and applied to back of box, then packing put in from this roll up to the inside of collar at end of journal, then a plug or key applied in front of box, the packing in no case to extend above centre line of journal. In many cases, however, the packing was put in above centre line, the front plug was made of such dimensions that occasionally we would open the box cover and could not see anything but packing. Latterly some of the roads got away from this process by discontinuing the use of the end plug entirely. It was found that this practice gave inspectors a better opportunity to examine the box and bearings, and by watching for dry centres of journals, bearings which would likely run hot were detected, the cause discovered and the necessary remedy applied. This change has done a great deal to eliminate hot boxes.

"Our Canadian roads have been slow in making this change, however, and they lose considerable material when their cars go over into the States on account of these front plugs (which would weigh about one pound of packing in each box) being removed on other railroads and on returning our railroadmen put extra plugs back in cars which have had them removed.

"I have been associated with the Grand Trunk Railway for the past six years in lubricating their equipment and I do not hesitate to say that there are less hot boxes to-day than ever before per thousand car miles run."

Oil, like patent medicines, have their substitutes, frequently the latter showing their superiority. This was exemplified in the remarks of W. A. Booth, chief draughtsman of the G.T.R. at Montreal, when he said:

"I do not wish to hurt the feelings of any of our oil representatives here tonight, but in conversation with a conductor of a freight train some time ago, he seemed to have gotten out a substitute for oil. He said that whenever he had a hot box he ran back to his van and got some wood ashes out of the caboose stove, mixed them with the oil, and got to his destination without much trouble. You can take that for what it is worth. I think the shop people are sometimes to blame in that they at times will leave a knob or other irregularity on the top surface of the brass or key, and if this is not chipped off or removed it will likely result in a hot journal."

L. C. Ord, formerly connected with the

engineering department of the C.P.R., and who has recently returned from overseas, touched on the subject of wear as related to the varying sizes of the axle journals. His comment in brief was as follows:

"I do not know much about hot boxes to-day, but I have had a great deal to do with efforts to prevent them in the past. One speaker says most of the cars are running altogether on brass, another that they are running almost altogether on white metal. Both cannot be right. My personal opinion is that investigation will show that on most roads, and particularly in passenger service, more cars are running on white metal. A very important point in comparison of hot boxes to-day and years ago is in the diameter of the journals. A six-inch journal is moving across the brass at twice the speed of a, say, three-inch journal in the same train and even with the same load per square inch, is harder to keep cool. Another important factor is end wear. The bearing area at both ends of the brass has not increased in proportion with the weight of the car and end wear is greater and the lateral movement of the journal on the brass has a great deal to do with the displacement of the packing in the box, particularly in cold weather and in starting warming at the inside shoulder. There is another factor which is very important in so far as Canadian roads are concerned, and it is the question of low temperature. Railroading in Canada would be all right if it was not for the severe winters, and it is difficult during that season of the year to attend to journal boxes."

Here Mr. McVeigh asked for the expression of some of the members on the matter of end wear, as he had been informed that this was the source of some of the troubles of hot boxes. He also touched on the possibilities of the cone wheel having a more erratic movement than one with a flat tread. In reply, Mr. Ord stated:

"As the question has been put directly to me, perhaps I should answer it. The cone on the wheel is to assist in curving and to reduce flange wear. The question of sharp flanges bears on the same point. When you measure them up you never find a sharp flange without finding a large wheel and a smaller wheel on the same axle. It may be due to bad mating in the first place, or to unequal hardness of the two wheels, one wearing faster than the other in service. These wheels would hold steadily to the worn flange on straight track. The new coned wheel does very little 'hunting' from side to side on the rail. The side movement of the brass on the journal is caused by the swaying of the car body, due to track and service conditions and not to the wheels.

"The lateral wear of the brass is affected by the lubrication on its face and on the inside edge, which latter is a hard place to get at and the hardest place to lubricate, due to the displacement of the packing by the plunger action of the journal. If you had an X-ray machine and could examine carefully and readily the back end of the box at all inspection points you could prevent 75 per cent. of the hot boxes."

The mention of an X-ray machine brought a remark from Mr. McNair to the effect that such an apparatus was now in use, in the shape of an iron made of such dimensions that it would reach to the back end of the box, and with it it was not only possible to know how much packing was in the box, but that the same could be adjusted to the journal. The Club was fortunate to have at the meeting, R. W. Reid, an official of the Midland Railroad of England, and his remarks which follow give a good idea of English practice.

"I am very much interested in listening to this paper on hot boxes. I am engaged on a railway in England where the hot box trouble is not unknown. As you probably know, a very large proportion of the wagons are private property, and a large number of these wagons are lubricated by grease, which is fed through holes in the brass at the top. That practice has been found unsuitable for freight and passenger vehicles running at high speed, and 90 per cent. of the vehicles in fast freight trains run at a speed of fifty miles per hour, and are running in oil bearings, which are faced with white metal. We never count on the bearing wearing through. Several gentlemen here have referred to the quality of white metal and it is a very important thing. If you buy white metal indiscriminately you will find its largest constituent will be lead, and lead is not suitable for carrying heavy weights. To give you a good running bearing it must have a large proportion of tin in it. Most of the English railways lubricate the journals by pads carried on springs in a frame. This pad can be taken out. One or two of the roads use waste packing. Since the war there has been a common use of wagon stock and my railway—the Midland—and some of the others, have taken a record of the number of hot boxes occurring on freight trains, and also the type of box and the packing, and our opinion is quite definite that the waste packing is inferior to the pad. Some gentlemen have referred to the difficulty of examining the back end of journals. That does not exist where you have the pad. Altogether the pad has everything to recommend it. You speak of the difficulty of operating in this country on account of the severe weather. If you use mineral oil, as we do, this oil does not freeze until the temperature gets very low, but if you have water in your box, which is picked up when the engine lifts water at the troughs, you then have ice on the top and the bottom of the oil well. The waste packing has very little resiliency, and, with the present tendency to economy, the waste is taken out and cleaned and put back again, and it is then not as good as when it is new as the horse hairs or other springing materials have been taken out. I do not know whether you have tried the pads. If you have, it would be interesting to hear what results were obtained from them. We have another type of box used in India, where they have extreme heat, and they use an eccentric steel disc which is fastened on the end of the journal. The oil lies in a well in the box and the disc picks it up and throws it over the bearing. This box has given very satisfactory results. It is patented, however, and we have never used it in England. I thank you for the opportunity of speaking to you."

The mention of the oil pads for lubricating axle bearings brought forth a few remarks from Geo. E. Smart, master car builder of the C.G.R., who stated:

"I would like to discuss some of the points raised by Mr. Reid on the different appliances used on the British railways. A number of years ago suburban trains were equipped on the Grand Trunk Railway with ring oilers somewhat similar to the design used on electric and other machinery. They were a success during certain periods of the year, but failed during the extreme winter weather, resulting in some cases in burning of the journal and skidding of wheels. The pad system was also tried out in this country on trains running between Montreal and Ste. Agathe, on the C.P.R. This also was a success during summer weather, but gave trouble during the winter months. The pads were held or pressed up against the journals by means of small coil springs which were riveted to a metal frame inserted inside of the journal boxes, but the extreme cold was the cause of the springs breaking away from the frame, resulting in the pad not being held in contact with the journals, and in each case the railways went back to the ordinary saturated waste for packing the boxes, and there is nothing yet, that I know of, that will give any better result than this method."

A point that was touched on by B. C. Gesner was that of the possible magnetic action that might be created through the contact of the different metals and the subsequent effect on the temperature of the bearing. His theory was stated, in part, as follows:

"I am not a member of this Club, but I listened with very great attention to all that has been said, as I have had something to do with hot box troubles in my time and when we come right down to the final analysis of the question it figures out in dollars and cents. I am, in a way, connected with the Canadian National Railways, and have had a certain degree of supervision over the lubrication of their rolling stock for a number of years past.

To be continued

Canadian Machinery Drafting Course—Part V

The Circle, and Its Various Divisions, and Measurements of Angles Defined—More Problems Given Together With Explanatory Data —Fifth Plate of the Course

By J. H. MOORE, Associate Editor Canadian Machinery

BEFORE proceeding with this, the last portion on the subject of geometrical drawing, let us review briefly where we left off in the other two parts published. We have so far gone through the definitions, from a straight line up to the discussions of quadrilateral figures, and have also completed twelve problems dealing with the preceding matter discussed in these two former parts, so now let us first continue with the geometrical definitions before entering any further actual problems.

Circles

We have so far not stated in defined terms what a circle actually is, so let us consider this point.

A circle is a plane figure bounded by a curved line called the circumference, every point of which is equidistant from a point within, commonly called the centre of the circle.

A circle in turn has other lines which can run through it, each having their proper name, so let us consider a few of these.

Referring to the chart at Fig. 1, we first see the circle itself, O being the centre point. Fig. 2 shows certain added lines to the circle, each having their proper name, A being the diameter. B the radius, and C the tangent to that circle. From this we gather that—

The diameter of a circle is a straight line drawn through the centre, terminating at both ends in the circumference.

The radius is a straight line joining the centre with the circumference.

The tangent is a straight line which touches the circumference at only one point, called the point of contact.

Fig. 3 carries us still further. Here we see a line A passing through two points on the circumference. This is known as a secant. The line B represents a chord of a circle, or a straight line which joins the extremities of an arc, but does not pass through the centre of the circle. The space, or area C included between the arc and the chord line B, is called a segment of a circle.

Fig. 4 again shows some further terms.

The space or area A is called a sector, that is, the area included between an arc and two radii drawn to the extremities of the arc.

Fig. 5 illustrates what is termed as an inscribed angle, that is, an angle whose vertex lies in the circumference, and whose sides are chords of a circle. Fig. 6 at A shows concentric circles, while at B are shown eccentric circles, the meaning of each term being self-apparent, namely, that concentric means having a common centre, while eccentric means the very opposite.

The Measurement of Angles

Before passing on to the next figure let us for a moment consider what we know about angles. We have so far learned in this course regarding the triangles used, namely, the 30°-60°; also the 45°. On each of these there is one angle, which is termed a right angle, which, as we all know, equals 90°. To go still further, we know that if we construct a circle as shown at Fig. 7, and draw diameter lines AB and CD at right angles, that we obtain the angles E, F, G and H, each equal in turn to 90°, or four times 90, or 360 degrees for the complete circle.

Having established in the reader's mind this point clearly, let us pass on to Fig. 8. Here we see a circle divided into 20 parts. Each of these parts is equal; therefore we can take 360 and divide it by 20, which shows us that the angle in each separate sector is 18 degrees. We only point out this illustration to start the germ of the idea of angles into students' minds, for it is something which will very soon crop up in this course, when naturally we will go into the matter deeper. In the meantime students should remember that a circle has always 360 degrees, a semicircle (or half a circle) 180 degrees, and that the sum of the angles on any triangle must always equal 180 degrees.

Solids

We shall now consider solids. First, what is a solid?

A solid has three dimensions—length, breadth and thickness. (Readers will remember that plane figures had only two dimensions—length and breadth.) Solids are subdivided into classes, the more generally used of which are cylinders, cones and spheres. Fig. 9 shows a cylinder, Fig. 10 a cone, and Fig. 11 a sphere.

A cylinder is a solid having two equal parallel surfaces as bases, these being bounded by curved lines. The bases are usually circles, and such cylinders are called circular cylinders.

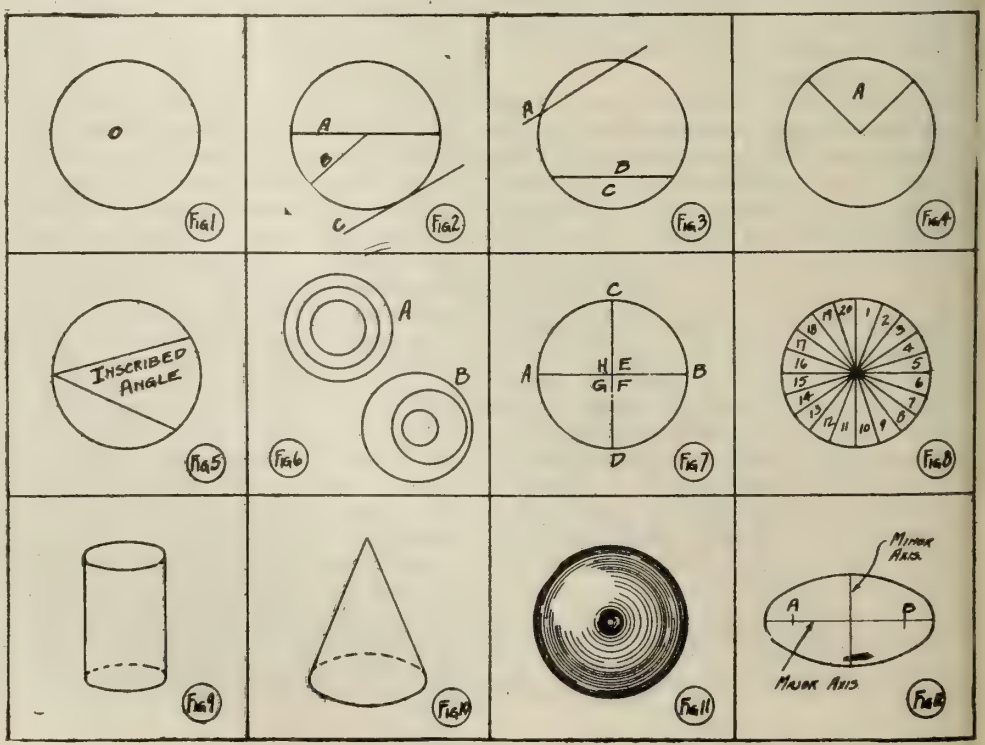
A right cylinder is one whose side is perpendicular to its bases. Fig. 9 illustrates a cylinder of this type.

A cone is a solid bounded by a conical surface and a plane which cuts the conical surface. The plane is called the base, the point which it tapers up to is called the vortex. The altitude of a cone is the perpendicular distance from the vortex to the base.

A sphere is a solid bounded entirely by a curved surface, every point of which is equidistant from the centre of the circle. A ball is a sphere, provided it is entirely round. Fig. 11 represents clearly the construction of a sphere. The shading on this view is given merely to create the appearance of the ball being round.

Let us now give one more definition before starting on plate No. 6.

An ellipse (illustrated at Fig. 12) may be defined as follows:



FIGS. 1 TO 12—FOLLOW THESE CLOSELY WITH THE TEXT.

An ellipse is a curve generated by a point moving in a plane, and in such a manner that the sum of the distances from the point to two fixed points shall always be constant.

The two fixed points are called foci (see Fig. 12 at A and B) and lie on the longest line that can be drawn through the ellipse. This line is called the major axis. The shortest line is called the minor axis, and is perpendicular to the major axis, at its centre or middle point.

An ellipse can be easily constructed if its major and minor axis be known.

Let us now proceed with plate No. 6.

The dimensions as before are the same, 9 x 13. The size of the plate, 9½ x 13 in., the trimming lines. The 1 in. space at the bottom is marked off for the title, and the remaining space, 8 x 13 in., divided into four parts as shown.

Plate No. 6

Problem 1: To draw a line tangent to a circle at a given point on the circumference.

With O as a centre, draw a circle 2½ in. diameter. Assume a point B on the circumference, and join B with O. Now construct a perpendicular to BO in the following manner: Produce the line BO to C. Choose any centre D and describe a circle of such radius that it will cut through point B. Where this circle intersects with the line BOC call by the letter E. Join E and D, producing it out to F. From F draw a line to B, and produce the same out beyond the circle as shown. This line will be tangent to the circle first made.

Problem 2: To construct an egg-shaped oval: From a centre O, with a radius of 1½ in., describe a circle. Through the centre O draw AOB; also a line OC perpendicular to AOB, cutting the circumference of circle at C. Draw the straight line AD at BE. With A and B as centres, and the distance AB as a radius, describe arcs terminating at F and G. With C as a centre, and CF as a radius, describe the arc FG, when you now have the egg-shaped oval complete.

Problem 3: To draw an ellipse by circular arcs.

Such an ellipse is not a true ellipse, but suitable for many purposes.

Draw AB 4½ in. long, CD 3 in. long. On the major axis AB, make AE equal to CD, then divide EB into three equal parts. With O as a centre and a radius equal to two of these divided parts, describe arcs cutting at F and G. With FG as a side, construct two equilateral triangles FGH and FGI, and continue these lines as shown. With H as a centre, and a radius HD, describe the arc, cutting at J and K. Then with the same radius, but with I as a centre, describe a similar arc, cutting at L and M. With A and B as centres, and a radius equal to the chord of the arcs AJ or BK, describe arcs, cutting AB near the points F and G. From these new points of intersection as centres, and with the same radius, describe the arcs JAL and KBM. Your ellipse is now complete, although, as said before, not absolutely accurate.

Problem 4: To construct an ellipse by the exact method, the diameters being given.

Let AB be the major axis 3½ in. long, CD the minor axis 2¼ in. long. With O as a centre and OD as a radius, describe a circle. With O as a centre, and OA as the radius, describe another circle. Divide each circle into a similar number of parts, the more parts, the more accurate the ellipse. For our purpose we will say 16. This is best done by dividing the larger circle into 16 parts, then drawing radial lines into the centre as shown on the top portion of the drawing. Through these points of division on the inner circle draw horizontal lines and through the points of division on the larger circle draw vertical lines, the points of intersection being the points on the ellipse. Trace a curve through these points, placing an irregular curve on them in such a manner that its bounding points will pass through at least three intersection points. Be careful not to make your curve too flat. Then ad-

HERE IS PLATE NO. 6. SEND US IN YOUR WORK AS SOON AS POSSIBLE.

DEVELOPMENTS IN SHOP EQUIPMENT

OLIVER NO. 166 HAND-PLANING AND JOINTING MACHINE

The illustrations show the No. 166 hand-planing and jointing machine that has been recently placed on the market by the Oliver Machinery Co., Grand Rapids, Mich. Fig. 1 shows the front of machine and its general appearance, while Fig. 2 is a detail view, showing the motor and cutter.

A direct motor drive is used, the machine operating at 3,600 r.p.m., on 3-phase, 2,220 volt alternating current. The cylinder is of the three-knife type, the outer end being shaped to receive the rotor. The stator is held by an adapter attached to the frame of the machine, and by the outer end cover.

The bed, table, in fact all parts, are rigidly constructed, and the capacity of machine is made in 5 widths, 9, 12, 16, 20 and 24 inch, respectively. Table permits a cut up to ¾-in. in depth.

The cylinder bearings are of the self-aligning, frictionless, ball type, requiring little attention.

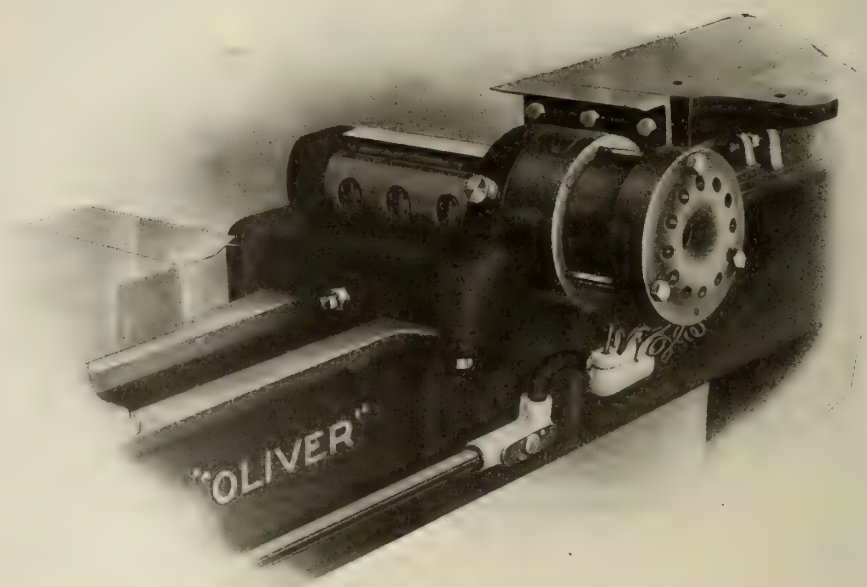

FIG. 2—CLOSE UP VIEW OF MOTOR AND CUTTER.

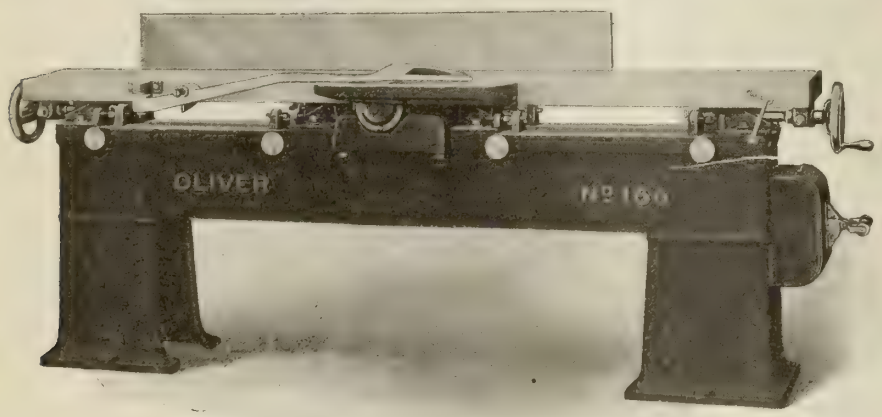

FIG. 1—GENERAL VIEW OF THE MACHINE.

The United Hammer Co., Boston, Mass., comment as follows: Safety devices being the order of the day, we have just brought out a guard for the Fairbanks power hammer, which, while it completely covers the working parts of the machine and thus prevents any possible injury to the operator—leaves the parts as accessible as before for the purpose of oiling and adjusting.

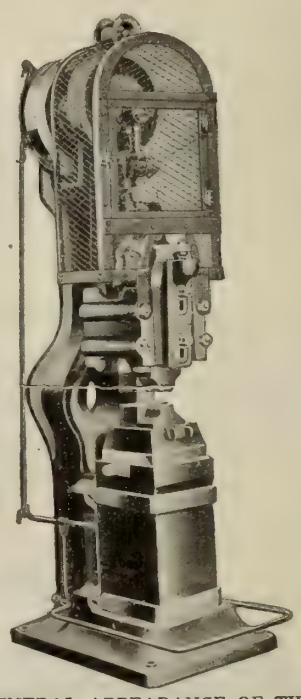
We know of no other hammer on the market which affords the same protection to the operator.

This guard is also easily attached to Fairbanks hammers already in operation and we are prepared to furnish it to all present users of these machines who may desire the same.

The illustration herewith shows the idea clearly.

It may interest readers to know that we are now prepared to furnish Fairbanks power hammers in sizes up to and including 500-lb. weight of ram; this last named size, together with a 400-lb., having just been added to our line. Heretofore Fairbanks hammers have been built only up to 300-lb. weight of ram.

These 400 and 500 lb. sizes have been brought out particularly for the heavier classes of work, such as found in locomotive and car shops, shipbuilding plants, tube and steel mills and also they will prove an excellent size on oil well tool work.



GENERAL APPEARANCE OF THE HAMMER.

"W. & B." HAMMERS

An unusual method of displaying hammers has been introduced by the Whitman & Barnes Manufacturing Company, St. Catharines, Ont. The Adze Eye Nail Hammer display is an attractive easel in three colors, mounting three handsome full-polished nail hammers—octagon, bell, and plain-faced types. The size of the easel, 15 by 11½ inches, not including hammers, makes it convenient for either counter or window display.

THE METHOD OF DISPLAYING THE HAMMERS.

These hammers are drop-forged, heat-treated, hardened and drawn to just the right temper for the work required of them. Special attention is paid to the design to see that the lines are correct, the balance perfect, and the striking power concentrated in the head. The handles are second growth, straight grain, white hickory, wax finished in natural color. A flare at the hand grip prevents slipping. Special steel wedges prevent the handles from coming loose.

A superior feature of the nail hammers is the peculiar design of the claws. The pitch is steep to give them a faster draw. The split permits the claws to take any nail down to the smallest brad, the grip being secure in the shank of the nail, not depending on the head. The value of this feature will be especially apppreciated on repair jobs.

NOTICE OF NEW CATALOGUE

The Wood Turret Machine Co. of Brazil, Ind., have issued a new catalogue showing a full line of the Tilted Turret screw machines, turret lathes, brass-working machines and extra capacity automatic chucking turret lathes. Illustrations and specifications of various types of screw machines and turret lathes are shown as well as cuts detailing the construction.

Several pages are devoted to new improvements and special construction.

Considerable space is given to tooling equipment and various special fixtures that can be furnished with or applied to the Tilted Turret.

A NEW MACHINE

The Riverside Machinery Depot of Detroit, Mich., have recently placed on the market the Daly combined die sinking, milling, and cherrying machine. This machine is equipped with adjustable taper bronze bearings, hardened cut gears, eight spindle speed, and powerful positive drive. We are informed that further information, including illustrated pamphlet, can be secured upon request by those interested.

"W. & B." AUTO TOOL DISPLAY

The Whitman & Barnes Manufacturing Company, St. Catharines, Ont., are offering dealers a handsome display of "W. & B." automobile tools, made in Canada. The essential tools, ball pein hammer, plier, adjustable "S" wrench, automobile wrench and screwdriver, are mounted on a steel easel 13¾ by 19 inches. The easel is lithographed in three colors, and the display makes a strong selling appeal when used on counters or in windows.

The tools are of the very highest quality, and all bear the "W. & B." diamond trade mark. The hammer is handsomely finished; head is a high carbon steel drop forging, hardened and drawn to just the proper temper, and secured to the handle with a special steel wedge. Handle is straight grain, air dried, second growth white hickory, wax finished in natural color. The pliers are made of drop-forged steel, finished either black or nickel-plated. It is of the slip-joint type, 6½ inches long, with screwdriver end. The adjustable wrenches are drop-forged and fitted with case-

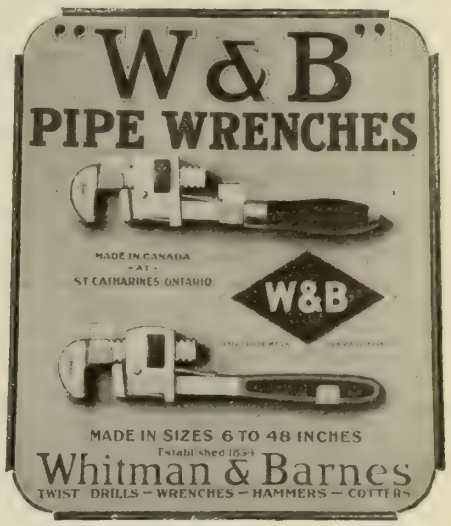
BOARD DISPLAYING AUTOMOBILE TOOLS.

hardened adjusting screws of the "W. & B." easy-acting pattern. Screw-driver blade is a tool steel drop-forging, fitted into a fluted hardwood handle with steel ferrule.

"W. & B." PIPE WRENCH DISPLAY EASEL

The Whitman & Barnes Manufacturing Company, St. Catharines, Ont., have a new display easel to assist their dealers in selling pipe wrenches. The easel is made of sheet steel, attractively lithographed in colors. It carries one each steel and wood handle pipe wrench, and is of such a size that it can be conveniently used either on the counter or in trimming the window.

In their endeavor to produce the finest product of its kind, the makers have



VIEW OF THE PIPE WRENCH BOARD.

spared no expense that would contribute to improve the quality. Bar and jaw are high carbon drop-forgings, heat treated and tempered to insure maximum strength. In addition, both bar and jaw are reinforced at points of extreme pressure or strain. The teeth are milled, insuring a slipless grip. Adjusting nuts are cut from solid steel and case-hardened. "W. & B." wrenches are so designed that the frame is rigidly supported by the drop-forged bar, relieving the frame pin from any strain.

The handsome appearance of these pipe wrenches is in keeping with their quality. The jaws and bars are highly polished and the ebonized wood handles are reinforced with steel ferrules.

CANADIAN MACHINERY DRAFTING COURSE

Continued from page 470

just your curve from time to time until the figure is completed. It requires considerable practice to draw a good curved line by this method, and readers would do well to practise this problem on a separate piece of paper before putting it on the plate. The neater the work, the better looking the curve, and a great deal depends on the student's taste and accuracy of eye.

Now, having completed the third portion on geometrical drawing, we will in our next plate take up an entirely different subject, so keep your eyes open for the next issue on this course, sending your work along as usual in the meantime. Have you secured a prize as yet? If not, why not this time?

Dangerous For Canada

THE latest strike in United States is poor business for that country, and poor business for Canada. It will give new life to the tired-out steel strike, for the very good reason that steel plants cannot run long without their supply of coke. Coal is not stored in very large quantities at the coking ovens of steel plants. It takes too much room and too much handling.

Canadian firms have had strikes and troubles of their own this year, and they have had them when they were trying to bridge the dangerous interval between war work and peace lines. Now they find that in addition to their own troubles they are hit by plottings and upheavals across the line.

There are Canadian manufacturers who cannot secure raw material with which to go ahead with their season's programme.

The agitator who is crippling the U. S. mines and steel plants is going to take work away from Canadian workmen this winter unless things turn very quickly for the better.

These things must be taken seriously by Canadians. A country with such natural resources as the Dominion should never allow its industrial future to be placed in such jeopardy as present conditions have revealed.

The Need For Apprentices

CANADA needs mechanics if she is going to succeed as an industrial and manufacturing country. Canada needs shops that will teach the apprentice something worth while rather than turn him out as a handy man or a specialist on Operation No. 4 or Operation No. 10, as the time card may call it.

There are tool rooms and there are drafting rooms that do not want to be "bothered with" apprentices. The one big demand of the institution is for production. The demand for producing great quantities of a given article in a short time is the big consideration, and in such an atmosphere it is an easy matter for the apprentice to become "handy" in some particular capacity and stay right there.

If your shop has nothing to offer an apprentice, be honest enough to say so.

You can turn out a mechanic—a rare man nowadays—a machinist, or a specialist. The boy who comes to your shop to learn a trade is entitled to know, all things being equal, what he has a chance of becoming. If only a specialist on some speed production idea, tell him so, in order that he may not waste three or four years of his time on it.

It is short-sighted policy, taking the mechanical field as a whole, to be too busy to "bother with" apprentices. If Canadian firms are going to turn out a product that will stand up in competition with the world, then we must have more and better mechanics. We must aim to bring mechanical excellence, knowledge and practice to such a degree that we can design and build precision tools as good as any on the market.

The shop that is too busy to "bother with" apprentices, but is willing to reach over and steal the finished product by means of a few extra dollars per week has a knot-hole conception of the duty it owes to the industrial fabric of Canada as a whole.

A Decreased Wage Coming?

PREMIER-TO-BE DRURY spoke for the Victory Loan at a meeting in Barrie, and gave it as his opinion that the day of the decreased wage was at hand. With this he coupled the statement that the day of the inflated price of wheat is also at hand.

In a general way the man in the factory will not quarrel with this state of affairs. For his purpose it makes little difference whether he earns $1,000 and spends it all for living, or whether he earns $2,000 in an inflated era and parts with it all in order to keep going.

The one big objection is that our national war debt was incurred in a time when dollars had small value. If we pass now to a period where there are fewer dollars with larger buying powers, it will not assist in liquidating our war debts.

The average man, though, is interested in the first instance in bringing about an era where he will get a fair run for his money when he puts his dollar into the markets.

Such a condition would do more than anything we know of to bring about a healthy feeling of satisfaction that would boot out the strike fever and the strike agitator along with it.

Mr. Drury also reasons that Victory Bonds are a great anchorage in going through the period of deflation which must surely come. The man with a holding of Victories in his possession can sit tight no matter what happens. He doesn't need to scan the papers each day to see if his security has slumped or gone up in smoke.

And it might not be bad business to go in and buy bonds in these days when dollars move in a big way, because as the buying power of your dollar increases, your bond becomes more valuable to you.

The Victory Bond proposition is sure, no matter whether you agree with all the to-be-premier says of other things or not.

THE average man does not love war. But there would be quite a heap of folks ready to sign on if General Reduction started operations hereabouts.

* * *

ALTHOUGH the farmers rule Ontario, Old Man Hicost lingers in our midst.

* * *

THE assurance of Washington that Canada will not be discriminated against in the matter of coal shows more spirit than the threat to cut Canadian power off United States when it was short here.

The Dangers of the Great Lakes Seasons

By T. H. FENNER, Editor Marine Engineering

THE salt water sailor is apt to sniff contemptuously when he hears of the sailors of the great inland waters of the North American continent. He is apt to refer to that class of navigation as dry land sailing, and to couple it in his mind with the navigation of the Mississippi, where the leadsman takes his soundings in inches instead of fathoms. When he is better acquainted with the problems and dangers of Great Lakes sailing he acquires a commensurately greater respect for the responsibilities and troubles of his fresh water brother. Most deep water skippers are troubled and uneasy when making the land, especially if the weather is thick and the shore is a lee shore. Their fresh water contemporaries are nearly always comparatively close to land, and whichever way the wind blows, a lee shore is not so very far away.

These thoughts were prompted by the occurrences of the past week when in the first of the fall gales, two vessels were lost on the lakes, taking a toll of thirty human lives. The "City of Muskegon," making for port in a heavy gale of wind, was thrown bodily on to the breakwater, and foundered in fifty feet of water right at the entrance to her harbor. Most of the passengers saved their lives by jumping ashore, so close were they to safety. However, before they could all reach it the ship went down and twenty-one lives went with her. The second vessel, the "Homer Warren," was simply pounded to pieces by the heavy seas, and went to Davy Jones's locker with nine of her crew. The tenth was saved by the fact that he was not aboard the vessel, but had gone home from the last port she touched at, by train.

Last fall, three brand new trawlers, built at Fort William, and manned by deep sea crews, left Fort William for the voyage to open water. Caught in a terrific gale, two of them disappeared from sight, and took their crews with them. One of them won through to safety, but had a terrible experience. The point is that these vessels were of a type that is usually able to ride out the worst weather that can be met with in the world's open waters. Even in that nightmare of all salt water men, the North Sea at its worst, these taut little trawlers make better weather of it than much bigger ships. Lake Superior proved too much for them, and Lake Superior is not the worst of the lakes. That doubtful honor is reserved to Lake Huron.

Even Lake Ontario can present dangers sufficient for the most adventurous. An old lake sailor told the writer a story of a trip on Lake Ontario which is worthy the pen of a Clarke Russell to do it justice.

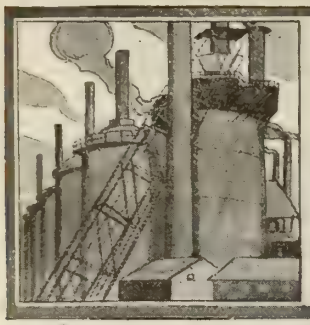
SOME years ago, the wooden steam barge "Resolute" left Port Dalhousie, loaded with about 800 tons of coal, and towing two schooner-rigged barges. She was bound for Deseronto, under normal circumstances probably a twenty to twenty-four hour run. The period when this voyage was undertaken was before the advent of that marvellous help to navigators, the wireless. The season was the late fall, about the middle of November. The weather when leaving Port Dalhousie was fine and clear, with a light breeze blowing. For the first few hours all went well, but as they proceeded northwards a change took place. The clear skies became clouded over, and the soft sighing of the breeze changed to that weird sob which usually heralds a severe blow. The wind increased, the temperature dropped, and as is always the case on these waters, the sea mounted rapidly. Before long it got so bad that the "Resolute," with her heavy tows, became unmanageable, and it was necessary to cast them adrift. Fortunately, the two barges were schooner-rigged and the crews were able to make a little sail, and bear up for shelter. This they reached safely, as was found out later, but for the time being they drop out of the picture.

Freed of her burden, the "Resolute" did better for a while. Soon, however, a new trouble developed. For some little time it had been noticed that steering was becoming more and more difficult. Examination of the rudder disclosed the reason for this. The low temperature was causing the spray thrown on the rudder pintle to freeze up and jam the rudder. When this was found out, a steam pipe was laid aft, and the jet directed down the pintle from above. This succeeded in freeing the rudder, and salt was freely sprinkled around the rudder head, which worked down the pintle and helped to keep it clear. Daylight had come by this time, but nothing could be seen but the viciously breaking waters. The captain judged his position to be somewhere near midlake, and knowing he could not hope to make Deseronto, he kept going straight down for the Thousand Islands. There was no sign of the weather abating, and all they could do was to keep the vessel riding as easily as possible. Getting down the lake in the vicinity of the Thousand Islands a fresh problem presented itself. If they went on, with the weather conditions as they were, and no clear assurance of their position, the chances were that the vessel would meet her doom on some of the rocky shores of the islands. The alternative was to turn back and run up the lake again, trusting to make Port Dalhousie. This was adopted, and after a hard struggle, the "Resolute" was turned round and headed up the lake, and to the south. As time went on the weather moderated, and finally they found themselves on a clear, bright morning close up to Port Dalhousie. This was just under five days from the time of leaving. Try to imagine five days buffeting with wind, sea, snow and ice, with land never far away, but practically out of touch with all the world. So much so that anxious families ashore had given their loved ones up as lost. The two barges, which had found shelter, had brought word of the "Resolute's" hard plight when she cast them adrift. The case seemed hopeless, and the relief was proportionately great when she came back, as it were, from the dead.

The business of the lakes must go on as does the business ashore, so once more the "Resolute," justifying her name, coaled up and started for Deseronto. Once more she left port in fine weather, and once more she ran into wintry winds and angry seas as she plodded north. Buffeting the gale, she proceeded down the lake, but as she approached the port her captain realized that he could never make it safely. He decided to proceed on to Kingston, reaching there safely and tying up after another hard struggle. Here word was received that they were to proceed to Deseronto, but feeling they had done enough, the crew signified that the only way to go to Deseronto was by train, for that season. So in Kingston she stopped.

THE classic instance of what the Great Lakes at their worst are capable of, is, of course, the terrible storm of November, 1913, which carried death and destruction on an unprecedented scale to the unfortunate ships and crews caught in it. This storm, which broke out on the 8th November, lasted till the 11th, and when it had passed on, left a trail of nineteen vessels totally destroyed. Two hundred and forty-four lives were lost. The property damage amounted to $3,157,000. All this desolation in just three days! Besides this, twenty vessels were blown

Continued on Page 84



MARKET DEVELOPMENTS

The Raw Material Shortage Is Serious

Shipments Have Been Falling Off for Some Weeks and No Betterment is Noticed—Some Firms Are Very Short of Plates and Sheets, With None Coming In

IT has been claimed in this report for some weeks past that shipments of steel coming to Canada from the U.S. strike zone did not bear out the contention made that production at mills was increasing quite rapidly. Events of the past week have shown this to be increasingly so. Shipments are more tardy than ever, and there are places where not a pound of sheet or plate has been received for almost three weeks.

One Canadian manufacturer returned this week from booking a nice line of tractor business in the Canadian West, and at once set to work to buy the material required to go ahead. On approaching the steel market he found that his troubles had only begun. He was not able to secure any material, nor was he able to get a delivery promise that would be of any assistance to him for purposes of winter manufacture.

The coal strike, if it lasts, will make matters worse, and may have the effect of putting new zest in the rather tired-out steel struggle. Steel mills use such a tremendous amount of coal that it is not possible to store a supply for any length of time. They depend, rather, on a steady supply coming in, the coal going directly and at once to their coking plants.

Delivery dates are still some distance in the future on machine tools, and considerable business is being lost to some firms on that account. As a general thing a dealer acts as an exclusive agent, and if he cannot get anything better than a May delivery from his principals, he simply has nothing left but to pass up the business.

The scrap metal market is in a poor condition for the moment. Strikes, and talk of strikes, has battered down any strength the market had. Buyers look for lower figures while sellers do not want to take the prices offered at present by the dealers. The result has been the bringing about of a condition not far removed from stagnation.

CANNOT SECURE ENOUGH MATERIAL

Shipments of Steel Are Away Off And The Demand is Growing Very Keen

TORONTO.—The coal strike on top of the steel strike in United States is causing certain industries on this side of the line to stop and think where it is all leading. There can be no question about the fact that the number of serious strikes across the border has a very unsettling influence on business in the Dominion, especially in lines where the finished product here depends on the raw product that comes from some point in United States.

Deliveries Are Slow

Agencies in Canada which are handling American lines are losing sales in many cases because they are not able to get deliveries that will satisfy their customers.

There is still a tendency on the part of many firms to trade in their used equipment, and the exchange of goods in this way tends to keep quite a quantity of material in the used machinery market. One Toronto firm has been placing in its warehouse a quantity of used machines that have been rebuilt at a factory outside the city. There has been quite a steady work in this line for some months past, in fact, much of it has been under way since the clearing out of the shell shops.

Shipments Are Very Slow

"We are at our wits' end to know what to do," was the response that CANADIAN MACHINERY received on asking one Toronto warehouse what shipments were coming through from the strike area of United States. "We thought we were having tough skidding last week, but this week is worse many times over. It is now over 17 days since we have had a shipment of sheets or plates in our warehouse, and orders that were booked to go direct to our customers are faring very little better. Last week we thought we were fortunate because we received a good sized shipment of boiler tubes, but on looking through them we find that the mills that shipped to us were away off on standards, and that most of the material we received were lengths and sizes they had in stock. The ability to ship the much-wanted sizes would have been proof to us that they were operating at something like fifty or sixty per cent. capacity, but it looks as though they were off entirely."

It is hard to convince some of the consumers in this district that production is up to sixty or seventy per cent., as is claimed in many of the reports that are reaching here from the strike district. Seconds in sheets are being bought up eagerly, the buyer apparently being willing to make the best he can of what may be in the shipment.

A Case in Point

One Ontario manufacturer, who conducts a nice business in one of the manufacturing towns of the province has just returned from a trip through the Canadian West, booking tractor business for spring delivery. On his return he found that he had orders for between 75 and 100 machines, so he immediately started to visit the warehouses and agents with a view to securing a supply of material, only to find out that he could get no promises of delivery, let alone any ready material that could be sent along as a starter.

The prices quoted on another page of CANADIAN MACHINERY this week have not been changed because business is being booked at old prices, but there can be no doubt that the prices we give are purely nominal. It is well known that premiums are being paid in many cases, depending on the urgency of the business.

As a general thing it can be stated that the large steel companies across the line, headed probably by the Steel Corporation, are adhering to old prices, and as the last report of the corporation showed very large earnings, there seems to be good reasons to suppose that prices will not go up, although it must be admitted that the scarcity of ma-

terial now is tending to make them unusually firm.

The Scrap Market

Industrial uncertainty, strikes, and all the other things that are parading across the business stage at present, have acted as a road roller to the scrap metal market. It is a hard matter to size up the situation at all. There is only a small volume of business moving. Sellers do not want to take the prices that are being offered by the dealers at present, while on the other hand buyers, watching the trend of the market, are under the impression that prices are due to slump.

It did look a few days as though the whites were due for a better period, and it was felt that there might be some increase in these, but for the present they are dull and stagnant.

In reference to the prices of metals it is well worth noting that cast iron and stove plate, when spoken of in tons, mean net tons in Ontario, and gross in Montreal.

STEEL STRIKE IS BEING FELT NOW

Several Industries in Windsor District Have Very Little Raw Material on Hand

WINDSOR.—As the steel strike in the United States continues Border Cities industries, while suffering from the lack of steel, are putting up a gallant battle to keep their businesses going, and although conditions at present are far from satisfactory, they hope that they will be able to proceed with their work until matters over the border are settled. An official of the Canadian Bridge Company stated that the company is managing to get a little steel, but not nearly as much as their normal import and that it is difficult to say exactly how long the plant will be able to continue operations.

The steel possessed and made ready for export to Canada by American firms prior to the strike has gone up in price and is difficult to obtain. Very little steel is being secured from Canadian factories. Most of the factories in the Border Cities using steel in the manufacture of their outputs frankly admit that they are up against it, and will have to close shop if more steel is not forthcoming in the near future.

The Dominion Forge and Stamping Company of Walkerville, which has been inconvenienced, will probably be able to open in about 10 days, it was announced to-day. This company expects to get a shipment of steel shortly, and officials are confident that business will soon be resumed as usual and with a normal output.

Large Marine Engines.—The Goldie and McCulloch Co. of Galt shipped to Three Rivers and Quebec two of the largest marine engines ever built in an inland Canadian city. Both engines are for the Canadian Government marine and will be installed in "Canadian Trapper" and "Canadian Settler."

COAL ON TOP OF STEEL STRIKE CAUSES CONCERN IN PITTSBURGH

Special to CANADIAN MACHINERY.

PITTSBURGH, Nov. 5.—The iron and steel strike, now in its seventh week, has been receding at a decidedly more rapid rate in the past ten days than in earlier weeks. The most marked progress in resumption of operations has been in the Mahoning Valley, where for about three weeks there was no operation at all. The Carnegie Steel Company is now operating about four of its six blast furnaces in Youngstown, together with one of the two Bessemer converters and a few of the open-hearths. Seven finishing mills at the Ohio works are operating while practically the whole McDonald plant, nearby, is in operation. The Carnegie operation is the more remarkable from the fact that the company made no strong effort to resume operations, feeling that the distinctly home companies, particularly the Youngstown Sheet & Tube Company and Brier Hill Steel Company, should lead the way. These two companies, together with the Republic Iron & Steel Company, are now showing a fair operation, having among them about six blast furnaces operating, with corresponding steel and finishing departments. Reports from the Chicago district are of much better operation there, but information is lacking here as to details.

Western Pennsylvania is now running very nearly full, with the exception of Donora and Monessen, which are still greatly crippled. Tonnage outputs are very satisfactory. For instance, one large plant, whose output was curtailed at the height of the strike by one-third or more, has lately been producing at 80 per cent. of the average rate in 1918, this being equivalent to 85 or 90 per cent. of the rate just before the strike.

A detailed estimate, by districts, based upon such information as is available, indicates that steel production is now at about 63 per cent. of the rate obtaining just before the strike. While this indicates quite a curtailment remaining, it should be noted that the production is well in excess of any output attained prior to the year 1912, and in those earlier years the steel industry thought it was producing a very large tonnage.

Bearing of Coal Strike

The iron and steel strike, however, has had to yield the centre of the stage to the coal strike, which is of importance both as to the curtailment in steel production it may cause, if prolonged, and as to the influence it will exert upon the subject of strikes in general.

The steel mills have some stocks of coal but these stocks are not large by comparison with consumption, it being a physical impossibility for a steel mill to stock sufficient coal to last it any considerable length of time, too much space and too much handling being involved. Some of the mills claim that they have stocks sufficient to last for four weeks, but the general average cannot possibly be as high.

The coal strike is different from all other strikes in that it is directly contary to law, the Government having decided that it is in violation of the Lever food, feed and fuel control act, passed as a war measure, and in force until the President issues his peace proclamation. The coal strike is in violation of the contract the miners' officials signed with the operators, but of course, that does not differentiate it from many other strikes that have occurred.

The extent of the coal walkout cannot be stated definitely at this time. There are conflicting claims. It may be assumed that the walkout is quite general if not almost universal at the union mines, but there is no walkout at all at non-union mines. Interest centres chiefly upon the rate at which men go back to work, as the operators as well as disinterested observers expect that they will go back. The injunction granted Oct. 31, at the instance of the Government, forbids the union officials to do anything in furtherance of the strike, though it does not apply to the miners themselves. Accordingly, the situation

POINTS IN WEEK'S MARKETING NOTES

The automobile business continues to be the large buyer of tools in U.S. market.

Shipments of sheets and plates are becoming very tardy, and some plants are not far from the point where they will have to close down some departments.

It is not possible for steel companies to store coal to keep them going for any length of time, it calling for too much storage space and too much handling.

Premiums are being paid in Canada for deliveries of sheets and plates, although the steel companies are themselves sticking to the old schedule.

Scrap metal market is dull, buyers looking for lower prices, and sellers not wanting to take the prices that are offered.

Several very nice orders for machine tools have been lost lately because delivery dates were too far off.

Pittsburgh reports some sales of bars at $2.50 to $3 a ton premium, and sheets at a premium of $2 to $4 per ton.

is the same as if the union officials had called the strike and then suddenly disappeared. The general belief is that the Government will use all its resources to prevent anything being done in furtherance of the strike, this applying to activity of union officials, the paying of strike benefits, and efforts of strikers to intimidate workers. Often the Government is slow to begin acting, but there is no question once the beginning is made.

One point in the change of conditions produced by the Federal Government taking its stand against the strike is in connection with the Connellsville region, which has always been non-union. Previously it had been thought very probable, in coal and coke circles, that in the event of a strike of the union mines the strikers would march upon the Connellsville mines and close many, if not all of them. The moment the Federal Government announced its position this opinion was changed. Furthermore, Governor Sproul, of Pennsylvania, has made a plain statement that order will be maintained. It is regarded as established that the Connellsville region will operate, and this is very important in view of the fact that from an exclusively coke producing region it has in the past few years become a large shipper of coal. It may be estimated roughly that in normal times the region produces half a million tons of coal a week, which it converts into coke, and half a million tons of coal which it ships.

Among steel producers the view is that the coal strike will help to settle the steel strike. If the coal strike fails promptly it will further undermine the morale of the remaining iron and steel strikers, while if the the coal strike is severe enough to curtail the production of steel the iron and steel workers will be given some idleness they were not counting upon, making them the more ready to go back to work when opportunity is afforded.

Steel Prices

While basis prices for steel products are being held down by the United States Steel Corporation and large independents adhering to their former prices, the March 21 schedule, export prices have shown a sharp advancing tendency and some of the smaller independents, able to make early deliveries, have been charging advanced prices, this representing in substance a delivery premium. Merchant bars have thus been sold at $2.50, Pittsburgh, or $3 a ton premium, and sheets at $2 to $4 a ton premium.

Pig iron is showing a sharper advancing tendency. The first stiffening in pig iron prices occurred towards the close of June but it has been only in the past few weeks that the market has been strongly advancing. Eastern Pennsylvania prices are up a total of $4 a ton from the low point of last June, and Buffalo, Cleveland and Chicago are all up, by an average of perhaps $2 a ton. The latest advance is in the local market, No. 2 foundry (1.75 to 2.25 per cent. silicon) being now squarely on the basis of $28.75, valley furnaces, or $2 above the March 21 prices, which the furnaces had adhered to until quite recently. Some odd lots for prompt shipment have been sold at much higher prices.

There has been an irregular market in Connellsville foundry coke, which sold as long as a week ago at $8.00 per net ton at ovens, as an outside price. Ordinary good brands have been quotable in the past few days at $6.50 for open top loading and $7.00 for box car loading.

AUTOMOBILE BUSINESS IS STILL BUYING HEAVILY IN U.S. MARKET

Special to CANADIAN MACHINERY.

NEW YORK, Nov. 6, 1919.—In the face of the strike of soft coal miners and other labor troubles, the demand for machine tools and allied equipment continues to be remarkably good. One of the largest inquiries now before the trade comes from the General Electric Co., Schenectady, N.Y. A list of about 50 tools issued two or more weeks ago has been supplemented by another list of about 60 tools, and there will be further inquiries. New equipment is to be bought by this company for a new shop at Schnectady for the manufacture of wireless telegraph apparatus.

Eastern machine-tool builders continue to get a good volume of business from the automotive industry. Such companies as the Studebaker Corporation, South Bend, Ind.; the Nash Motors Co., Kenosha, Wis.; the Samson tractor works of the General Motors Corporation at Jamesville, Wis., the Stromberg Motor Devices Co., Chicago, and others have been fairly large buyers. In the East a new automobile company, the duPont Motors Mfg. Co., Wilmington, Del., in which Alfred I. duPont is a prime mover, will shortly be in the market for equipment. The Willys Corporation is preparing a list of its machine-tool requirements for its recently acquired plant at Elizabeth, N.J.

Miscellaneous buying of equipment has been done within the past week by the Delaware & Lackawanna Railroad, J. H. Williams & Co., Brooklyn, the Otis Elevator Co., for its Quincy, Ill., plant, and the Dexter Folder Co., for its plant at Pearl River, N.Y.

PIG IRON TRADE

Pig iron is advancing in price, and consumers are having a hard time to secure metal. 1920 iron is being sold at advanced prices. Following are reports from various U. S. centres:

Chicago.—There is a heavy demand for iron, and furnace stocks are being rapidly depleted. Foundry iron for first half is being quoted at $30 furnace, and malleable at $30.50 furnace. Malleable and silveries are both scarce, making their position strong.

Boston.—The demand for foundry iron is in excess of the supply, and foundries are taking odd lots, regardless of the analysis. 1,000 tons of No. 2 for first delivery was sold at $32. High silicon iron for immediate delivery has been sold as high as $35 Eastern Pennsylvania furnace. Total sales amount to about 7,000 tons, for last quarter and first half.

New York.—Business has been lighter, not because of a decrease of demand, but the difficulty of obtaining iron. Melters have had to pay higher prices for prompt iron, 2.25 to 2.75 silicon brought $33 Western Pennsylvania furnace. A fair amount of charcoal iron has been sold in this district for first half, and 1,000 tons foundry has been sold to a Japanese buyer.

Pittsburgh.—Furnaces are generally fully sold up for this year, and prices of foundry and malleable continue to mount. Shipments for balance of the year cannot be procured under $30, and single car loads are realizing more than that. There is still reluctance in booking 1920 business, until more is known about production costs.

Buffalo.—A sale of 10,000 tons for the first half at $29.50, Buffalo, has been made, an advance at $2.25 over former price. A fair quantity of foundry iron has been sold at $31 to $34.

Cleveland.—Heavy sales of foundry iron for first half are noted here. One interest has closed business for 100,000 tons in the past two weeks, mostly from first half. Pig iron for immediate delivery is very scarce, and matters are being complicated by difficulty in securing cars.

Philadelphia.—Iron is becoming so scarce that fancy prices are being paid in some cases. No. 2 X has been sold $33 Eastern Pennsylvania furnace. All Eastern furnaces are sold up for this year. There is a little iron available in Virginia. An Eastern consumer has bought 1,500 tons basic at $28 delivered. No. 2 X for first half is quoted at $32 to $35.

Cincinnati.—Ohio furnaces are now opening their books for first half business. One furnace has booked orders for first quarter of first half at $29 Ironton, while a second has placed $29.75 as the minimum for 1920 delivery.

St. Louis.—A large amount of iron in small lots has been sold during the week and the demand is good. There are a good few enquiries coming along for next year delivery. A sale of 25,000 tons basic at Chicago for first quarter delivery has been made at $25.75 furnace.

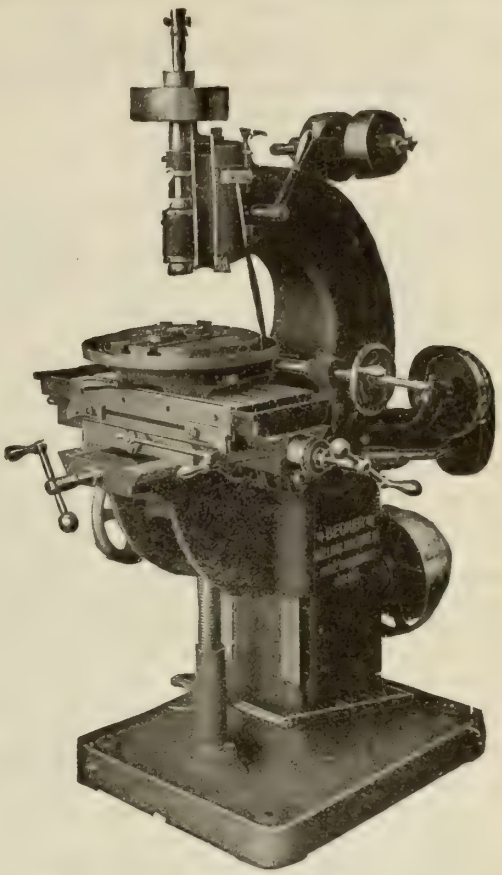
BECKER

Belt Driven Millers

The Machine that Gives the Smooth Finish

Stringent shortage of labor during the war put a premium on machinery of superior productive ability. Never was the capacity and value of Becker Millers better emphasized than during that period. And Becker Millers will always continue to demonstrate their ability to return maximum production for minimum expenditure of manual effort.

Send us blue prints of your work and other data and we will submit estimates on Becker production. Adopt this "safety-first" course; it may mean added profits to you.



The A. R. Williams Machinery Co.
LIMITED, TORONTO

Acid Electric STEEL CASTINGS

Acid Electric Steel Castings show superior ability to resist wear and crystallization. They are smooth in texture, free from Blow Holes, and machine perfectly. We specialize in

Railroad and Other High Grade Castings

up to 15 tons, any specification. Electric Steel Castings COST NO MORE than ordinary Steel Castings.

U.S. SCRAP METAL

The scrap market is showing more activity lately. Foundry grades and machinery scrap are selling well. The car shortage is interfering with business in some places:

Chicago.—With the resuming of work by steel mills the scrap situation has been improved. Prices are showing an upward movement, and heavy melting and rolling mill material is in good demand. Cast scrap and cupola grades are selling above the local pig iron prices.

Boston.—There is a very ready market for machinery scrap, and a price of $28 is easily obtained, with a few sales at $28.50. Steel making grades on the other hand are decidedly quiet. Considerable scrap has been offered lately by the war department.

Pittsburgh.—Foundry scrap has been in strong demand recently, and No. 1 cupola scrap has sold at $25 to $26 delivered. Better prices than this have been secured on some small lots. Another grade in good request is railroad malleable. Railroads are offering 26,000 tons scrap steel.

New York.—Boring, turnings and heavy melting steel are still in demand. Heavy melting is quoted at $15.50 to $16.00 f.o.b. New York. Clean cast borings have advanced to $14.50 and machine shop turnings to $12.

Philadelphia.—There is a good demand for all kinds of scrap, and heavy melting steel has sold at advanced prices. Machine shop trimmings and borings have been sold freely, while the charcoal iron industry has been buying forge and bundled sheets. Cast scrap is also in demand.

Buffalo.—Prices remain the same, but dealers are looking forward to a better market when steel mills get on a normal basis. Heavy melting steel, turnings, borings, malleable and cast are in demand.

Cleveland.—Cast and malleable are in good demand in the Cleveland district, and mills are increasing their production. There is a great shortage of cars. Dealers are holding their scrap and refusing offers above published quotations.

Cincinnati.—There is very little scrap being moved, chiefly on account of the difficulty of getting cars. Some local foundries are buying small quantities that can be delivered by truck. Prices are really nominal transactions, being too few to form a guide.

St. Louis.—There is little movement of scrap, but the limited supply is a source of strength. Dealers are looking forward to the end of the steel strike for a period of good business. Rerolling rails are quoted at $28 to $28.50, this material being in good demand.

Birmingham.—Heavy melting steel is being held for higher prices, and there is a good demand for cast and stove plate, borings and shop turnings. Good business is looked for unless the coal strike disturbs things too much.

FIRESTONE PLANT GOES TO HAMILTON

The By-Law Was Carried There by a Very Large Majority

Hamilton: By overwhelming majorities the electors of Barton township carried the by-laws which assures the Firestone Tire and Rubber Co. making Hamilton its headquarters. Under one proposal the company will pay taxes on an assessment of $100,000 for twenty years, and under the other on an assessment of $150,000 for twenty years. The full school rate, income and business tax will will be paid on all holdings. The vote on the ten-year by-law was 954 in favor and 27 against, the twenty-year by-law 772 in favor, 143 against.

The company has purchased 150 acres east of the city limits on the bay front, including the property owned by Sir Henry Pellatt of Toronto. About two-thirds of it will be used for factory purposes, the first units, on which work will be started at once, employing 2,000 people. The southern part will be devoted to a model town, the company building its own high class houses and encouraging its employees to buy them.

The Jenckes Spinning Co., of Pawtucket, R.I., owners of the largest spinning mills on the American continent, has already declared that it would locate here as soon as the fate of the Firestone by-laws was decided. This company will erect a plant that will give employment to 1,000 people It is said to be one of the first of a number of companies that will follow the Firestone here.

WILL SPECIALIZE IN FORGING NOW

Sale Made to Ford Co. of Plant for the Making of Fenders, Etc.

An industrial transaction of major importance was consummated in Ford City, Ontario, last week, when the Dominion Forge & Stamping plant was purchased by the Ford Motor Company of Canada. The property in question is situated to the south of the Grand Trunk lines, near the Ford plant. The Dominion Forge & Stamping Company has been engaged in the manufacture of fenders, sheet metal work and frames for the Ford Company.

The purchase of the stamping plant means that the motor car firm will make these parts itself, and will leave the Dominion Forge Company free to make forgings and other parts in its second plant. An inventory of the plant involved in the sale was commenced on Friday last, and it is anticipated that the final valuation will be between $700,000 and $800,000.

Expansion of the forging plant by the Dominion Forge Company to take care of larger requirements will probably be an aftermath of the transaction.

The Dominion Forge & Stamping Co., as the result of the sale of these two stamping plants, will devote their entire interests to the forging business, and will be in a better position to handle any kind of drop forging business to customers' blue prints and specifications. At the present time the firm is practically doubling the capacity of their Board Hammer shop, and is installing a new 8,000 pound steam hammer and a new 5 in. forging machine.

FEAR WORKLESS WINTER IN EAST

New Glasgow People Wait to Hear About Development at Scotia Plant

New Glasgow.—A large mass meeting was held in the Itzit Theatre to discuss the question of unemployment at the Scotia Steel Works and the Eastern Car Plant.

The situation in New Glasgow and Trenton among workers at these plants has already become acute, and there is fear that a very serious condition will assert itself before many weeks. Both plants are practically without orders and the prospect is that they will be closed down unless relief comes. The men have already held a conference with the management, and the company is prepared to carry the financial end of any orders that may be secured.

At the meeting several of the workmen were outspoken in their demands for work and the danger of want and hunger which their families were facing. Messrs. Alex. McGregor, M.P., was present, but could not hold out any hope of orders from the Government. Hon. R. M. McGregor also spoke and favored a delegation to be sent to Ottawa to press for relief. This course will proably be followed. Already three men have been slated to approach the Government and the directors of the Canadian National Railway asking for car orders, and also orders for next year's railway supplies, such as ties, bolts, spikes, etc.

The men selected are Mayor Wier, of New Glasgow; Mayor Logan, of Trenton, and H. D. Fraser, president of the Federation of Labor organizations. This committee will be supplemented by business representations and proceed to Ottawa in a few days.

There is a sort of poetic justice in the news of the new sphere of activity of the famous German commercial submarine, "Deutschland." The enterprising Mr. H. Bottomley has acquired possession of her from the Admiralty, and she will be exhibited round the British coast, the proceeds of the exhibition to be given to King George's Fund for Sailors. It is worthy of note that her cargo space has a capacity of only 90 tons measurement, and two foot square package was the largest that could be accommodated through her hatches.

Geometric Production

Installing a Geometric Die Head, or other Geometric equipment, has increased production materially in many plants where an increased output was a vital consideration.

Below is an illustrated instance where a Geometric Die Head (threading machine type) was applied to an old bolt cutter and the production increased six times over what was being done with a solid die head.

Before taking it for granted that you are getting the best possible production on screw threaded parts, let us know what the work is, and we may be able to boost production for you.

The Geometric Tool Company, New Haven, Conn., U.S.A.

Showing the lower block in position for regular or low speed.

Aikenhead's

SPEIDEL'S "SIMPEX" Two-Speed Block

The novel feature of the lower block is the simple and ingenious method of securing two speeds, which is of great value where variable loads have to be lifted.

This device is self-disengaging when the load has been hoisted at the fast speed and is lowered below the point from which it has been raised.

This is of great importance and makes this Hoist valuable in connection with cranes and other hoisting machines.

Drop us a line for full information.

MONTREAL NOTES

That steps are being taken to relieve the shortage of ocean tonnage is shown in the recent announcement of A. G. Henderson, one of the Glasgow directors of the Cunard and Anchor lines, when he stated that quite a number of vessels were now under construction for the Atlantic trade of his company. In addition to providing increased tonnage for the old trade routes the companies are preparing for other new routes as post-war requirements demand. Mr. Henderson intimated that some of these new boats would probably be ready for the Montreal route for the opening of the season of 1920.

* * *

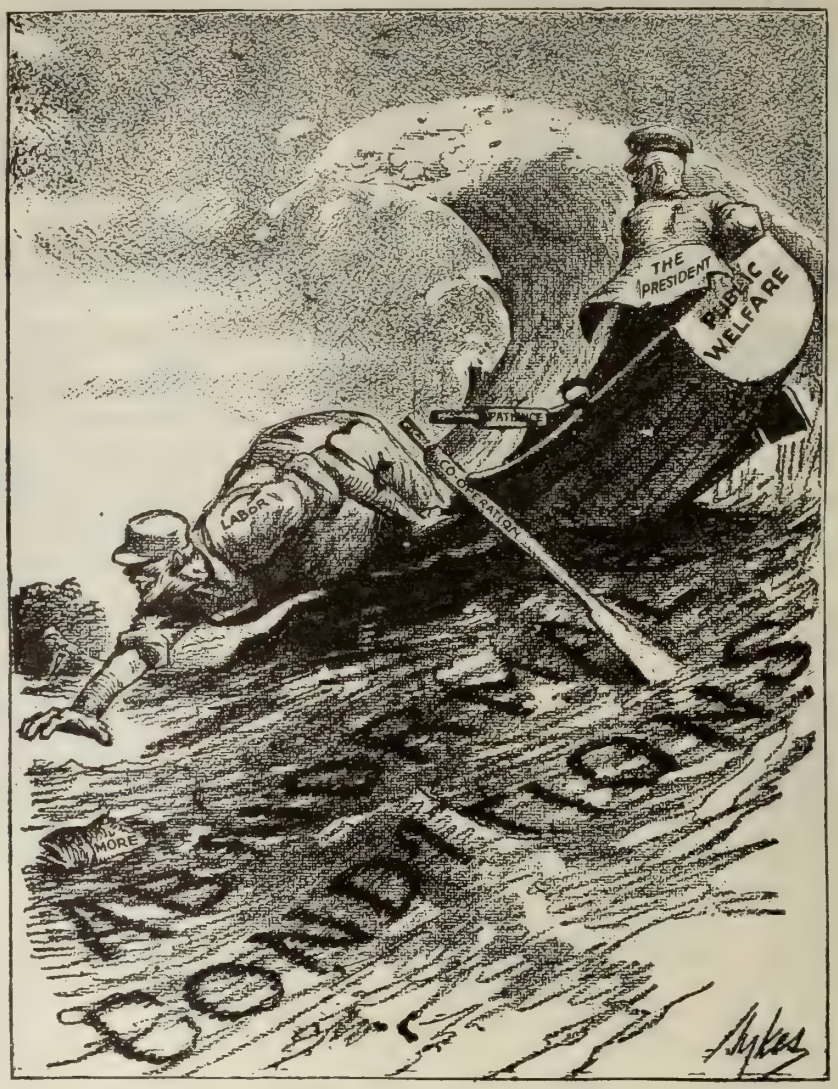
Further impetus is given to the activities of Canadian interests in the incorporation of the International Corporation of Canada, with head offices at 112 St. Francois Xavier Street, Montreal, with a capital of $2,000,000. While the primary object of the company is to trade in products made by Canadian manufacturers, the scope of their activities will be world-wide, as it is the intention to establish agencies in all the principal countries of the world, not only to look after the interests of Canada but likewise to develop trade in all parts of the Empire backed entirely by Canadian capital. The gentlemen associated with the company are prominent in Canadian financial and industrial activities, and it is expected that further announcement as to the names of the directors will be made shortly. It is understood that H. B. Thomson, formerly Canadian Food Controller, will occupy an executive position with the new company.

* * *

The practice of coaling Transatlantic steamers on this side, for the return trip, has become additionally pronounced during the past couple of months, owing to the recent unrest in the industrial situation in England. However, this condition will probably be remedied in the near future as an agreement has been reached between the striking railroad men and the Government, whereby they will return to work while negotiations are carried on. For some time past the congestion of the docks on the other side have become so great that restrictions in shipping have been very necessary. From now on it is expected that relief will be shown in this connection.

* * *

J. W. Norcross, president of the Canada Steamship Lines, has recently returned from Europe, and is very optimistic regarding the shipping activities, both of this and other countries. He states that British and French shipping interests anticipate a period of several years of continued favorable conditions as exist at the present time. Of his own direct interests Mr. Norcross stated: "Developments that have already occurred in the Atlantic business of the Canada Steamship Lines have more than justified this, and important extensions and improvements are now being contemplated." He looks for considerable emigration from the British Isles to Canada during the coming year, and appreciates the fact that shipbuilding and industry in general will greatly benefit by the additional skilled labor that will be available.



Sykes in Philadelphia "Public Ledger."

"Sit Down"

* * *

The Halifax Shipyards Limited has just recently completed the rebuilding of the old "Lake Manitoba," which was stranded in the harbor of Montreal about a year ago, and was in consequence eliminated from all shipping registers. The "new ship" will bear the name of the "Iver Heath," and, it is interesting to note that the repairing and reconditioning of this vessel was the second largest repair job ever accomplished on the Western Atlantic seaboard. The boat has just undergone her trial trips, and her initial performance has reflected great credit on the builders, and fully satisfied the group of experts and officials that were on board, and who keenly watched for any defects to show in the engine-room or on or off decks. When the engines turned over at a speed of 13½ knots, the representatives of Lloyds were so well pleased that they certified an A-1 classification at Lloyds. Four other ships of large tonnage are now under construction at these yards, and it is expected that the first of these will be ready for launching about the first of the year. The yard is particularly busy, and about fifteen hundred men are constantly employed.

Some idea of the changing conditions that are taking place in world commerce may be gathered from the export of coal that has recently taken place from this country. While this state of affairs is largely due to the recent attitude of British labor, there is, nevertheless, a possibility that trade of this kind may be permanent in character. The steamer Ariant, recently arrived at Halifax with a general cargo, has been diverted from her regular activities and will take on a cargo of coal at Sydney for the United Kingdom. Another instance of coal trading is the shipments of fuel that are now going to Holland. Some time ago the Netherlands Government obtained some 90,000 tons of Canadian coal, and it has been been announced that the Dutch Government are so well pleased with the quality of the coal that a further order for upwards of 200,000 tons has been placed.

A Miniature Hot-Blast Cupola Furnace in Action

This Little Cupola May Look Like a Toy, But It Has Features Which Should be Worthy of Consideration in Full-Sized Foundry Cupolas

Fy F. H. BELL, Editor Canadian Foundryman

THE illustration shown in Fig. 1 is from a photograph of the float which represented the part taken by the Owen Sound Iron Works, Limited, in the Trades procession in honor of the returned soldiers a short time ago.

A story of the procession and the reception given to the returned heroes would make interesting reading, as such stories always do, and any story treating on this subject should be appropriate in any class of magazine, but to

FIG. 1—FLOAT CARRYING HOT-BLAST CUPOLA, SHOWN IN FIG. 2.

do it justice requires ability beyond that possessed by the writer of this humble narrative. We will therefore refrain from saying much about the reception, suffice to say, Owen Sound did herself nobly, as she always does; the procession alone being of sufficient magnitude to require ninety minutes to pass a given point.

As we have already said, the float shown in the illustration is that of the Owen Sound Iron Works, of which Mr. James Higham is the foundry foreman. On the wagon will be seen the little cupola shown in Fig. 2, and it is of this little cupola that we wish to speak.

This cupola is the the invention of Mr. Higham, and to show that it is no toy we might explain that Mr. Higham had it in blast all through the procession and had men making moulds and pouring them with metal taken from this cupola.

Dimensions of Cupola

From the sand bottom to the top it is 36 inches and the outside diameter is 12 inches, inside diameter 8 inches. It has two tuyeres, each 1½ inches in diam. It is small, but can and does melt iron, and as Mr. Higham says, it is because it is a hot blast furnace The tuyeres never get bunged up, because the slag slips right past them.

There are lots of furnaces which will not melt continuously for ninety minutes.

Now it is not its size which we will dwell upon so much as its design and the ideas involved. The line sketch shown in Fig. 3 will, perhaps, show more clearly the details of its different features. As will be seen, it is on trunnions and can be swung over on its side for convenience in preparing for the succeeding heat. By this means the workman can do a lot of his work without working in the dust and draught. This feature can be adopted on the largest-sized cupolas and can be tipped by mechanical means. But this is only one of its minor characteristics, the main point being the blast arrangement.

As is well known, every cupola has what is known as the melting zone above which iron does not readily melt, and cast iron blocks have frequently been used to good advantage instead of bricks in this part of the lining, standing the abrasive action of the descending iron and fuel better than fire bricks. But of course every part of the cupola is hot, and while this part of the lining does not get hot enough to melt and run down, it gets near to it and in time it burns out.

In the furnace here shown the lining above the melting zone consists of a one-piece cast iron pipe of the proper inside diameter. This pipe is flanged at the top to fit the inside of the shell. The bottom of the pipe rests on top of the ganister lining of the melting zone, which zone would, in a larger furnace, of course, be bricked up with fire bricks. This makes the entire furnace above the melting zone a continuous hollow jacket. The blast pipe connects to this as shown in the illustrations, and from this to the tuyeres by outside pipes, also shown. The cold blast on entering this jacket has a cooling effect on the inner tube, thereby prolonging the life of the tube, while at the same time absorbing the heat from the tube, and delivering hot air to the tuyeres.

It must be remembered that this hot air is not burned air as every bit of oxygen which the cold air contained is still in it in addition to the numerous heat units, which radiated through the inner tube into the wind chamber.

Now, as we have shown, this is a very small sample of a melting furnace and if a larger one were being constructed, certain changes in the proportions might be found advisable. Characteristic of coke fires in a cupola, the height of the melting zone does not vary in proportion to the size of the furnace, and if the furnace was a large one, projecting up to the second storey of the building, the melting would still be done at the bottom and the zone would not be much higher than in this one. In such a case the inner tube could reach down close to the melting point, and this change would make other possible changes loom up. For instance, the cold blast might be made to enter at the lower part of the belt, where it would be more effective in cooling the

FIG. 2—HOT BLAST CUPOLA.

inner tube where it most required it and also where it would absorb more heat from the inner tube. It might also be advisable to have the pipes leading to the tuyeres connect at the top, where the heated air is most likely to be. But Mr. Higham has all of these points thought out. He has some notion of presenting this one to the Owen Sound Technical School, and building a somewhat larger one for Labor Day celebrations, etc.

Mr. Higham is a native of Stockport, Cheshire, England, and some years ago operated a foundry at Levenshulme, near Manchester, and it was there that he worked out his idea of adopting hot air to cupola practice.

Iron and Steel in Occupied Germany

FROM April 14th to May 3rd a Commission appointed by the Minister of Munitions, and composed of Sir W. J. Jones (Ministry of Munitions), Mr. P. S. Cooper (the Partington Iron and Steel Company), Mr. R. C. Harding (Robert Heath and Sons), and Mr. Cosmo John (Vickers, Limited), visited certain steel works in Lorraine and Saar Valley with a view to reporting upon the developments which had occurred at the works during the war, the present conditions of their plant and machinery, the prospects of the works acting as competitors with British industries, and the developments in fuel economy practised at them.

While the iron and steel works of the Saar Valley worked at high pressure throughout the war, those in Lorraine suffered severly from lack of fuel, and had, especially towards the end, to be damped or closed down for several weeks on end from this cause. Lubricants also gave out towards the close of hostilities, and in some instances both in Lorraine and the Saar Valley serious damage was caused to machinery as a result. In spite of the confident assertions of the German Press, no satisfactory substitute for manganese seems to have been found by the steel makers. Calcium carbide in conjunction with reduced quantities of manganese was employed, but at only one works did the Commission receive assurance that its use was at all satisfactory. At others testimony was received indicating that it gave very bad results, as much as 30 per cent. of the steel produced with it being scrap. Powdered anthracite was used as an alternative de-oxidizer, but was not a success.

The damage suffered by the steel works from bombs appears to have been slight. The Hagondange—formerly Hagendingen—works received 400 bombs, and the works at Hayange 150. Nevertheless, the total damage was estimated at but £5,000, while the loss of life was comparatively slight. Signs were, however, found that the moral effect was considerable.

Dealing with present conditions, the Commission reports that the shortage of furnace coke is severely restricting the output of the blast-furnaces, and consequently of the steel works, which in all cases use hot blast-furnace metal. The iron and steel works of Lorraine are dependent upon the coal and coke supplies from Westphalia, a fact which places them in a very unenviable position. Up to the present, however, the Germans have failed to provide the fuel in the amount specified under the Armistice terms. In the Saar Valley the works are less dependent upon Westphalian fuel, but it is necessary to mix Westphalian coal with Saar coal in order to obtain a good furnace coke.

There are 68 blast-furnaces in the province of Lorraine. Of these 60 were in good condition at the date of the armistice, although only 5 were in blast. Since then as many as 27 or 28 have been simultaneously in blast under the French authorities, but at the time of the Commission's visit the number running was less, and those which were at work were on short blast owing to the scarcity of fuel.

Under the terms of the armistice the Germans were required to deliver 13,700 tons of suitable furnace coke per day. During November and December very little was handed over. In January the deliveries averaged between 5,000 and 6,000 tons per day, but in February and March they fell to between 2,000 and 3,000 tons. Since then the quantity delivered has been negligible. Altogether, instead of 1,500,000 tons, they had delivered at the date of the Commission's visit only about 500,000 tons.

There is no shortage of labor at present, but to prevent unrest the French authorities are paying the workmen full wages during their periods of partial or complete idleness. At the date of the armistice there were approximately as many Germans as Lorrainers employed at the Lorraine iron and steel works. Certain Germans have been sent back to Germany, but for the most part those who remain have no desire to leave. They wish to become French subjects; they are not troublesome, and agree with the French element.

In Lorraine all the iron ore used is obtained from local deposits, being generally brought by aerial rope-way from the mines, which in no case are farther than 11 miles from the works. The ores are of two qualities, calcareous and silicious, and are used jointly to give a self-fluxing mixture. The ores are phosphoric, and the pig iron produced at the blast furnaces is nearly all used for making basic Bessemer steel, their being generally a steel works attached to the blast furnaces. The blast furnace gases are extensively used for driving the works and plant. Generally speaking, the gases are first roughly cleaned and then in part used in the heating stoves of the blast furnaces and under steam boilers. The remaining portion is further cleaned, and is employed in large two-cycle gas engines driving the blowers and in four-cycle gas engines driving the rolling mills, etc. Electric driving of the mills is used in few cases, but the advantage, according to the Commissioners, seems to be less in practice than in theory.

The blast furnaces are in nearly all cases built of brick and banded, very few having steel shells. They are lower and their hearth areas are larger than would be the case in this country for similar outputs, and are only driven at very moderate rates considering the size of the hearths. Only one case was found in which the rate of combustion of coke exceeded 200 lb. per square foot of hearth area per hour. At nearly every works visited plant for producing slag bricks was found. The slag is granulated by being run molten into water. The granulated material, with about 5 per cent. of lime added as a binder, is allowed to rest for 24 hours and is then formed into bricks in machine presses, each of which is capable of turning out 10,000 bricks per day. At some of the steel works a slag cement plant has been laid down.

A feature of the works in general visited by the Commission was the large size and good arrangement of the stock yards. It would appear that the steel works execute a large number of orders from stock, and thus act as their own warehousemen. At one works at much as 27,000 tons of steel were found in stock, while at another 15,000 tons was stated to be the normal quantity held.

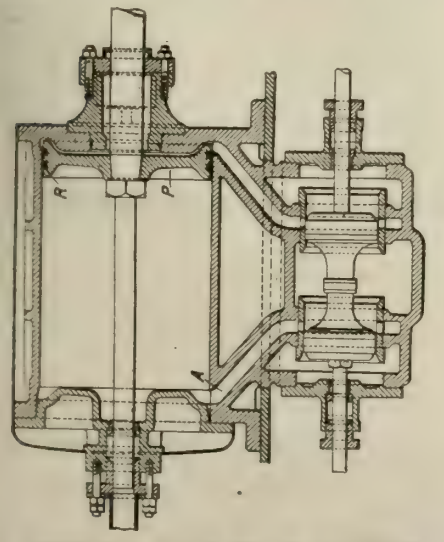
As a consequence of the large demand for electrolytic copper during the war, the price advanced very greatly and many concerns for manufacturing this product were opened in Japan. The raw material for this industry was obtained from the Chinese bronze coin, which was imported into the country in large quantities until the Chinese Government prohibited its exportation. At present the prices of electroytic and ordinary copper varies so slightly that it does not pay to manufacture the former. Copper sheet manufacturers are also hard hit by the decline in prices and some of the large concerns are suspending operations or giving up this branch of business.

UNIFLOW LOCOMOTIVES

The Uniflow type of engine cylinder has been applied with considerable success in England to locomotive design. The accompanying illustrations show the design developed by the North-Eastern Railway at the Darlington works. Three cylinders are installed, each of them 16½ in. dia. by 26 in. stroke. The design of these and their difference in appearance from the ordinary piston valve cylinder may be seen in the line drawing.

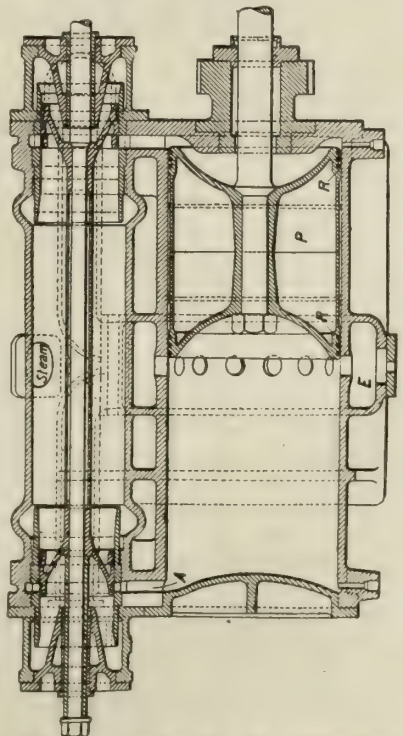
ENGLISH UNIFLOW LOCOMOTIVE

The "Uniflow" principle differs from that of an ordinary cylinder in that the steam entering at one port does not have to return to the same point, but escapes through an exhaust port provided in the middle of the cylinder barrel. The steam, therefore, has only a forward and no backward movement; hence the term "Uniflow." Owing to the fact that the exhaust is in the middle, it is necessary to increase the length of the cylinder to about double what it would otherwise be, in order to allow the steam which enters through the port at one end of the cylinder to press forward the piston for the same length of time or distance before exhaust, as is done in the case of the ordinary engine. The piston in a "Uniflow" cylinder is called upon to govern the exhaust instead of, as in the usual type, leaving that function to the slide or piston valve. The piston is a hollow casting, with spring rings at each end, which prevent any steam passing through to its other side. It is claimed that this piston, being hollow and full of air, protects the live steam of the piston from the disadvantageous effects which the ordinary narrow piston possesses, due to its being a single solid surface, one side or the other of which is always wet from exhaust steam.



SECTIONAL DRAWING OF ORDINARY CYLINDER.

We are indebted to the North-Eastern Railway Magazine for the information contained in this article.



SECTIONAL DRAWING OF UNIFLOW CYLINDER.

Standardization of Roller Chains—The Association of British Driving Chain Manufacturers announce that they have now completed the standardization of roller chains up to 3¾ in. pitch. For the convenience of chain users, and to insure complete interchangeability they have also standardized chain wheel tooth forms. These new tooth forms, while not being identical with any of the existing forms, incorporate the essential features of each. Particulars of the standards set up by the Association of British Driving Chain Manufacturers are to be published in pamphlet form which will be obtainable from the secretary of the Association of British Driving Chain Manufacturers, Bassishaw House, Basinghall street, London, E.C. The association comprises the following well-known firms: Alfred Appleby, Ltd., Birmingham; Brampton Bros., Ltd., Birmingham; "The Coventry" Chain Co., Coventry; Perry & Co., Ltd., Birmingham; Hans Renold, Ltd., Manchester.

The John H. Hall & Sons, Ltd., Brantford, Ont., have issued a very attractive catalogue on their complete lines of pipe lathes, rapid nipple machines and roller pipe cutters.

The cover of this catalogue is a novelty in itself. The already well-known wheel trade mark is stamped out in such a manner as to show the five members of the concern, including the founder, J. H. Hall, who recently passed away. In addition to the regular catalogue, material, repair charts, and instructions for the operator of machines is included. Data on the care of dies for such machines is given, which is exceedingly valuable, for, as a rule this question does not receive the care it deserves.

Taken in all, this catalogue is well worth having to anyone interested in these lines.

In "La Nature" an account is given of an automatic regulator for low-temperature electric furnaces, the invention of which is ascribed to M. Lequeux, whereby the temperature is accurately controlled. The device consists of a glass tube inclined at 30 deg., and connected at its upper end with a vessel containing a fluid which undergoes considerable dilation under the action of heat. The lower end of the tube connects with a vertical cylinder containing mercury in which is an adjustable piston. In the sloping tube, where the mercury enters up to a certain height, are spaced platinum contacts connected with points on the coil of a rheostat. The device is placed in the furnace, and when the latter is cold the platinum points are short-circuited by the mercury. The furnace, therefore, receives the full current. With a rise in temperature the liquid in the upper vessel expands and forces down the mercury, thus putting into circuit a succession of the various sections of the rheostat connected to the platinum points and diminishing the current. The device is intended primarily for laboratory furnaces heated by electricity, but the same principle may be applied to other forms of apparatus so heated.

"You don't mean to tell me you ever doubt the wisdom of the majority?"

"Well," responded Senator Sorghum with deliberation, "what is a majority? In many instances it is only a large number of people who have got tired out trying to think for themselves and have decided to accept somebody else's opinion."—Washington Star.

MAKING STEEL IN CANADA

Continued from page 464

eight hundred pounds (800 lbs.) of coal, each pound of coal makes about sixty (60)) cubic feet of gas (at 60° F.)

The great advantage of gas as a fuel lies in the fact that a low grade of coal can be used, that coal and ashes can be mechanically handled, and the gas and air heated before combustion takes place.

We have now followed the iron ore from its hiding place in the depths of the earth through the blast furnace where the major portion of its impurities are purged away, through the open hearth furnace where the refining is carried still further, and we now have ingots of steel weighing from three thousand (3,000) to eight thousand (8,000) pounds each. Before rolling, these ingots have to be heated in either a soaking pit furnace or a continuous heating furnace. They are then rolled, first in a mill, called a Blooming Mill, which reduces them from ingots of, say, sixteen inches (16 ins.) square to blooms 6 ins. x 6 ins. square. These blooms are then re-heated and rolled into billets, and the billets in turn rolled to the various bars required.

In the cast of steel plates, the ingots are cast in the form of a slab and worked between plain rolls until the desired size and length is obtained. Large structural members as "H" beams and "I" beams are rolled from an ingot cast roughly to the contours of the beam.

The original mills with simple stands of rolls and the bars had to be placed between them and lifted from one pass to the other by man-power. Modern mills are provided with tables of all descriptions to eliminate this hand work and secure immense outputs.

THE GREAT LAKES SEASONS

Continued from Page 475

ashore, receiving damage to the extent of almost half a million dollars. The vessels lost and stranded were of all sizes, from 2,800 tons d.w. to 10,000 tons d.w., and besides the distinctive lake type of carrier, included vessels of the tramp type. These were built in Great Britain, fit and seaworthy to navigate any waters that would float them. Eight of the vessels disappeared totally, among them being the "Wexford," a British-built ocean-going tramp. The "Charles S. Price," a 9,000 ton lake carrier, was found after the storm floating bottom up, with her bow end out of water. Later she, too, sank completely.

The wind at its maximum attained a velocity of 79 miles an hour, and averaged 60 miles an hour, and raised such a sea as has, perhaps, never been raised on the lakes before or since. Vessels running before the wind were continually pooped, the seas filling the engine room, and smashing every deck erection in its path. Those headed into it found it impossible to keep their vessels head up, and they gradually fell off into the trough, where they were pounded by the heavy seas till they foundered, or were driven ashore and smashed to pieces.

That gale will live long in the memory of Lake sailors, and the inhabitants of the towns and villages of the lake shores. It ranks among the great marine disasters of the world, and it is to be hoped that the inland waters will never suffer such another catastrophe.

At the time this happened, much speculation was rife among the uninformed, and among many that should have known better, as to why these ships could not survive a heavy blow. Salt water men pointed out that the British-built tramp did not founder, but was driven ashore, a very different happening. They claim that had the vessel had sea room, she could have lived through any gale. This is practically true.

The answer of the lake sailor is that their vessels are not intended or built to stand such conditions. They are built for carrying a heavy bulk cargo on the least possible draught. They have the reports of a capable weather bureau to guide them, and if bad weather threatens, they remain in port. If on their voyage, and conditions become adverse, they can usually gain shelter. They point out that the percentage of loss to total traffic is decidedly low, but when a loss occurs it is usually of a spectacular character, which focuses attention on it. It practically amounts to the fact that a lake carrier, caught in a heavy storm, stands a good chance of being lost. On the other hand, an ocean-going vessel takes storm and calm all in the day's work, and unless close on a dead lee shore, does not worry much.

If the two types of vessel are studied a little, the reason is apparent. Take two vessels of the same tonnage, one an ocean-going vessel, and the other a bulk carrier of the lake type. A 10,000 ton d.w. ocean-going steamer will have dimensions of approximately 450 feet long by 56 feet beam by 38 feet deep. She will have engines developing 4,000 h.p. The lake carrier of the same size will be 524 feet long by 54 feet beam by 30 feet deep. Here is a great difference. Her engines will be only 2,200 h.p. A greater difference still. The ocean-going steamer has her engines and boilers amidships, and in the bottom, and light or loaded, trims on a practically even keel. The lake boat, on the other hand, has her engines right aft, and the boilers usually set in the 'tween deck. She trims by the stern, and when running light, there is a difference of 10 or 12 feet between the draught aft and forward. Now, what are the conditions of the two vessels in the same waters, and the same weather? The ocean-going ship, full loaded, will be drawing about 29 ft. She has ample power, and steers well. The lake boat will be drawing roughly about 19 or 20 feet. It is at once apparent that of the two vessels the ocean-going steamer is easier to handle. The extra length, less draught, and low power of the lake steamer makes her, in severe weather, almost unmanageable. In very severe weather she becomes helpless. Then again the sea that runs on the lakes is very high, with short intervals between the waves. These seas break very quickly, and the effect is a series of hammer-like blows delivered unceasingly. The fabric cannot resist it if long continued. Now, in open water the seas are long, and a vessel has time to rise and fall to them. Very rarely does the bulk of the sea break on a vessel. It is usually just the crest of the sea that falls on the deck. When a vessel does get under the weight of a real Atlantic roller, she comes into port with her upper works levelled to the deck, and a story of a tidal wave.

I have tried to show in this limited space what the mariners of the Great Lakes have to contend with. As a salt water man, I feel a deep respect for them and their work, and would like to see Canadians in general take a deeper interest in this phase of their national life.

ONE SHORT YEAR AGO

Go back a year—in memory.
Then we **hoped** to win.
We believed we would win.
We were willing to spend every cent in Toronto for Victory. Every man, woman and child in Toronto was prepared to pay any price if only we could achieve Victory.
Now Victory is ours—Complete and decisive Victory.
If you were asked to **give** to the Victory Loan 1919, you should do it in thankfulness for Victory.

But you are not asked to give—only to **lend** your money.
—On the best security in the world.
—At a good rate of interest.
If every citizen of Toronto will make it his duty to support to the utmost of his ability the Victory Loan 1919, we can gain such a reputation for Toronto as will astonish all Canada.
The money is here.
Why not make this a record?

Montreal 32 Front Street West, TORONTO Winnipeg

STEEL MAKING IS GOING AHEAD NOW

Work at Sydney Commences After a Shut-Down Lasting for Some Weeks

Sydney.—Steel making is once more in progress at Sydney Mines. After a shut-down of three and a half months, a portion of the open hearth furnaces of the Nova Scotia Steel and Coal Company are once again producing ingots. The re-lining of the blast furnace has just been completed, and steel officials expect to have the furnace blown in within the next few days. Under the most favorable conditions it takes several days to relight a furnace and produce a cast, but it is not the intention of the officials to force a quick cast, as the new lining is to be given every chance to become gradually accustomed to the increasing heat pressure. The blast furnace and open hearth furnaces were closed down about the first of July and have been under repairs ever since then. The first ingots since that date were produced a few days ago. As far as could be learned winter prospects at the Scotia plant during the coming winter are fairly bright. This seems to be particularly true as regards the steel industry. The company, it is understood, have some fairly large orders in view, but have not yet closed with them. Negotiations are in progress, and unless some unforeseen obstacle arises, the contracts will shortly be completed. The situation at the collieries of this company seems to be somewhat uncertain at present. Just now three of the four collieries of the company are working every day, while the other, the Jubilee, operates from three to four days per week. Whether this situation will continue indefinitely will depend largely on market conditions.

CATALOGUES

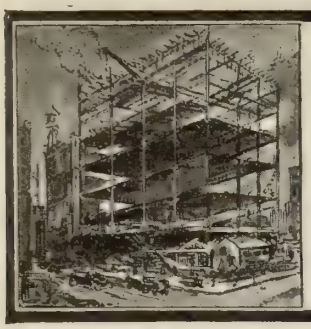
Paul O. Abbe, 30 Broad St., New York City, have issued a condensed catalogue (F), listing specialties such as ball and pebble mills, rotary cutters, mead mills, hammer mills, bolting reels and mixers. Bolting cloth, grinders and vacuum pumps are also listed.

The W. S. Rockwell Co., 50 Church St., New York, have issued a very useful steel heat-treatment chart, on which is given valuable data to anyone interested in this subject. We are informed that they will forward one of these charts to those interested upon request.

J. H. Williams & Co., makers of superior drop-forgings and drop-forged tools, with works at Brooklyn and Buffalo, N.Y., have just issued a catalogue, 4 by 6 inches, 160 pages, fully illustrating and describing their standard stock specialties. These include several lines of new goods, viz.: "Agrippa" turning-tool holders, set-screw pattern; "Agrippa" boring-tool posts; "Vulcan" forged-cutter tool holders, and several new assortments or sets of drop-forged wrenches.

The book contains, also, a description of the drop-forging process in very simple, non-technical style for the benefit of those not conversant with its details.

Plate Next Year.—After completing a tour of inspection of his company's properties, President Mark Workman of the Dominion Steel Corporation has returned to Montreal. Mr. Workman states that some of the furnaces at Sydney have resumed operations. With the completion of the new ship plate mill, which will probably become a producer early in the new year, an additional demand will be made on the furnaces. "The demand for steel products," said Mr. Workman, "is improving. There is, also, an urgent need for coal the world over, and it is this branch of our operations on which we are now concentrating our attention. With our unequalled loading facilities at four ports on the Atlantic seaboard, we are in an exceptionally advantageous position to take care of export and bunker coal requirements, and we are bending every effort toward raising our output to its normal level, in order that we may meet the conditions to the largest possible extent."



INDUSTRIAL NEWS

NEW SHOPS, TENDERS AND CONTRACTS PERSONAL AND TRADE NOTES

PERSONALS

A despatch from London, England, says: Roger Beck, director of Baldwin's, the great Welsh iron, steel and coal firm, sails for Canada this week to inspect the big Toronto business, recently acquired by the firm and from which much is expected. It is a coincidence that Lady Rhondda, daughter of the late Viscount Rhondda, is in Canada on business connected with the working of mineral properties purchased by her father.

Mr. P. J. Melvin has joined the staff of the Marine Navigation Company of Canada, Ltd., where he will take charge of all matters connected with the booking and handling of cargo for this company. His headquarters will be in Montreal. Mr. Melvin has been for a considerable period in the employ of the Canadian Pacific Railway as export freight agent.

OBITUARY

The death occurred recently at Monteith of Mr. John Critchley, formerly a well-known building contractor of Toronto. Mr. Critchley had large mining, lumbering and other interests in Northern Ontario. He was secretary of the Public School Board, a prominent Liberal, Mason, and member of the Anglican Church.

Mr. Cowan, well known as a railway construction contractor, died suddenly after addressing a meeting of his supporters in the election campaign recently. Mr. Cowan was 68 years of age, and owned a large farm on the outskirts of Cannington, Ont. He is survived by a widow, one son and one daughter.

Mr. Barry Smith of the Dominion Construction Company, Toronto, met his death at Parry Sound under unusual circumstances. Mr. Smith was resident engineer on concrete construction in this district for the C.N.R., and was traveling in the conductor's van of a construction train when it was wrecked. Fire broke out and Mr. Smith was fatally burned.

Duncan McD. Campbell, formerly assistant city engineer of Halifax, and engineer on the staff of the Nova Scotia Highway Board, died at his home after an illness of about one year. Mr. Campbell was a native of Truro.

Mr. James Low, a prominent contractor of Ottawa, was drowned through falling into the Rideau Canal recently.

The death occurred at St. John's Hospital, Buffalo, of Capt. Clinton G. Innes. Deceased was one of the oldest and best known captains on the Great Lakes. He was 74 years of age, and had sailed the lakes since boyhood. For many years he was in command of steamers of the Pittsburgh Steamship Company. His last boat was the steamer H. H. Rogers of that fleet.

MARINE

Buffalo.—The bow of the steamer "Northland," which has been cut in two at the yard of the Cowles Shipyard, is now ready to leave Buffalo for Levis, Quebec. The Northland has been purchased by the Davey Shipbuilding Co., of Levis, which company purchased the bow end of the Northwest. The stern end of the Northland will be ready to leave very soon after the bow.

Detroit.—The United States Shipping Board have sold the steamers "Seneca" and "Bethlehem" to Great Lakes owners. The steamers will be delivered at Boston. The Seneca has arrived at Boston, and the Bethlehem will leave Portland for Boston as soon as she is discharged. The new owners are in Boston awaiting the vessels.

Cleveland.—There is very little shipment of grain, and most of the ore shippers are cleaned up. There may be better movement of grain at the beginning of the month, but many boats are being tied up. Several steamers have taken short cargoes during the week. Cold weather at the head of the lakes had the effect of delaying ore shipments, as the ore was frozen, and had to be thawed out before loading.

Guernsey.—At the entrance to the Russell Channel leading to St. Peters Port, Guernsey, Channel Islands, a lighthouse has been erected which is entirely controlled from the shore by means of a cable about 1½ miles long. This cable is of very strong construction, and carries current to control the light, and also the foghorn. The horn has been heard on the French coast 34 miles away. The lighthouse is called the Platte Fougere.

Toronto.—The old "Chicora," one of the most interesting vessels on the Great Lakes, foundered at her moorings at the foot of Cherry Street, through a leak of some sort. It is surmised that the packing may have got out of one of the seacocks, or something of that nature. The water came in faster than the pumps of the salvage boats, hastily summoned, could remove it, and she sank, snapping her mooring ropes as she went down. She will be removed.

Ottawa—Up to date 15 ships have been delivered to the Canadian Government Merchant Marine, and are in service There have been 25 sailings, and the tonnage carried aggregates 116,000 tons.

Bridgeburg.—The Canadian Allis-Chalmers have completed the steamers "War Magic" and "War Vixen," and they will have their trial trips at once. The yard has been working overtime in order to complete the vessels before the close of navigation. They are the standard 2,500 tons size built for the Imperial Munitions Board. There are two other vessels on the ways.

Grimsby.—A dredge that was being towed from Grimsby by the tug St. Paul, broke away from the tug during heavy weather, and sank almost immediately. Here the crew were taken off, but one man named John McLaughlin, was taken down by the craft and drowned. Two scows which were in tow were washed ashore later. They carried no crew.

TRADE GOSSIP

Natco to Enlarge Plant.—The National Automatic Tool Company of Richmond, Indiana, manufacturers of multi-drillers, have placed a contract for a new addition to their plant, which will be of steel and brick construction, and will be equipped with the most modern machinery. It has only been three years since the "Natco" doubled their capacity by enlarging their plant, but the increased demand for Natco multi-drillers, both domestic and foreign, necessitates this additional building, which will enable them to again double their capacity.

Textile Machinery Plant for Hamilton.—The Jenckes Machine Company of Pawtucket, R. I., are to build a plant in Hamilton that will employ 1,000 hands. The Jenckes Company is said to be the largest firm in the United States manufacturing textile machinery. Their locating in Hamilton is contingent on the Firestone Tire and Rubber Company ob-

taining the concessions they are asking off the town, as the plant of the Jenckes Company would be employed in making the machinery for the Firestone Company in the first instance.

Doing Quick Work.—Although the Ontario Steel Products received a severe blow in the burning of the company's plant at Chatham in the beginning of September, the energy of officials has to a large extent overcome the disadvantages of the situation, and in a very short time the company will be operating at 50 per cent. of capacity in a new building erected on the site of the old. Furthermore, advantage was taken of the destruction of the old factory to construct a modern fireproof structure, which will insure the company against unfortunate occurrances of a similar nature in the future. The shape of the new building will be somewhat different to that of the old, permitting centralization of operations and producing greater economics in manufacture. In this, they were assisted by the fortunate circumstance that, at the time of the fire, a new plant had been planned for Oshawa, after careful consideration had been given to all details. In consequence of this, a contract for the new plant at Chatham was let within a couple of days of the fire and building operations were immediately proceeded with. Already the plant has sufficiently progressed to permit certain operations to be carried on, and within a fortnight or so it will be operating at 50 per cent. of capacity. The company has more orders on its books than it can attend to for months to come, and, in spite of the interruption will, it is declared, have a good year.

Truck Factory Coming.—Towns in the Niagara district are competing with each other to secure a two-million dollar truck factory, which it is purposed to erect in Canada. This will be a branch of a large American factory with headquarters in Brazil, Ind. Bridgeburg men own some of the stock, and the Industrial Commissioner of Welland is endeavoring to land the industry for his town.

Competition For New Factories.—The town of Guelph is anxious to get new industries, but is not able to put up the inducements that Brantford is offering. Three of the firms which are negotiating with Guelph have announced their willingness to locate there if the same concessions are offered them as at Brantford. Brantford offers to build a new factory, charging the firm a rental of 8 per cent. on the total cost of the building, and giving the firm the right to purchase in five or ten years at actual cost. The firm offering these concessions has its bonds guaranteed by the town of Brantford. Guelph cannot offer any such conditions.

Department of Labor Statistics.—The returns from the Provincial and Dominion offices of the Employment Service show a decrease in the number of placements compared with the returns of the previous week. 8,222 persons had been referred to regular positions, and of these 6,949 received employment (1,294 casual jobs were supplied. During the week 9,097 applicants were registered, of whom 610 were women. Vacancies totalled 9,174, of which 705 were for women. The number of soldiers placed was 2,670, or 38.4 per cent. of the total regular employment placements.

Trade With the Orient.—There is a good opening for profitable trade with the Orient, but Canada is not pushing this to the same extent as the U. S., according to Mr. Gilchrist, a prominent Vancouver man, who has just returned from a trip to China. He said a big concern was being formed in China and was now ready to establish a passenger steamship line to Vancouver from Chinese ports.

Plenty of Coal in London.—London has more bituminous coal than she needs, according to Mr. A. M. Heaman, a leading coal dealer of that city. He said the same condition applied all over Western Ontario. A considerable portion of this coal was left over from last year.

Belleville Goes After Industries.—An industrial corporation has been formed in Belleville with a capital of $200,000 to aid and finance manufacturing enterprises that locate in the district. An automobile tire valve company was contemplating locating in Belleville, and a number of Belleville men were agreeable to taking stock in the company.

Chemical Industry for Vancouver Island.—An anouncement was made recently by Premier John Oliver that large deposits of alum and potash had been discovered on the west coast of Vancouver Island. The Premier stated that if at all feasible the industry would be developed in order to make Canada independent of the German source of supply.

Trade Fair for Britain.—A trade fair to be held simultaneously in London, Birmingham and Glasgow, lasting for a fortnight, is being organized by the Board of Trade. It will be the greatest ever held in the British Empire, and over a hundred thousand invitations will be issued. Only manufacturing firms in the Empire will be allowed to compete. The Crystal Palace will be used for the London fair.

Co-operative Shipbuilding. — At a Board of Trade meeting in Victoria the president of the G.W.V.A. made the statement that the shipyard workers would put up $350,000 if the business men would contribute $500,000 to ensure the continuance of wooden shipbuilding. A representative of the Cholberg firm called attention to the large number of sailing vessels lost during the war, and said that this class of vessel

Trade With South America.—A new company has been formed by South American, United States and Canadian engineers and business men to promote trade between North and South America. The firm will be known as Trading Engineers Inc., and will have offices all over South America. The Brazilian manager is at present in Canada endeavoring to interest Canadian firms in the South American market. The company has a capital of $450,000.

C.P.O.S. and Furness Withy.—Sir Frederick Lewis, of Furness, Withy & Co., has announced the completion of an arrangement with the Canadian Pacific to supply half the tonnage required in the services to Montreal and London, and Montreal and Antwerp. These lines are known as the Canadian Pacific Joint Services. The Furness-Withy Co. have also taken over the New York and Bermuda service of the Quebec Steamship Company, and have bought the steamer "Bermudian." In St. John, N.B., they have acquired the business of William Thomson & Company, who for many years acted as the company's agents in that port.

Albert H. Mitchel has become associated with H. W. Cotton, Inc., of Brooklyn, N.Y., as vice-president and general sales manager, with headquarters at their New York office in the Woolworth Building. Mr. Mitchel was formerly for nine years with Taft-Pierce Mfg. Company of Woonsocket, R.I., having been in their engineering department there, after which he entered the sales department as Chicago representative. For the last five years he has been at their New York office as district sales manager. The H. W. Cotton, Inc., have a large plant in New York State for designing and building jigs, tools and special machines.

Edward R. Abbott has joined the sales force of H. W. Cotton, Inc., of Brooklyn, N.Y. He will have charge of the Western business, making his headquarters for the present in the Woolworth Building, New York City, and later at Cleveland, Ohio. Mr. Abbott was formerly with the Taft-Pierce Mfg. Company of Woonsocket, R.I., as a member of the sales force of their New York office for several years.

Fire Did Not Stop Them.—The Eureka Pattern & Mfg. Co., Ltd., 337 King St. West, of which D. B. Adamson is the manager, had an unfortunate fire in their premises on Sunday morning. It is not going to put the firm out of commission, as they are already prepared to go ahead with their lines of making patterns, designing jigs, tools, etc.

A New Machine.—The Williams Tool Co., Erie, Pa., manufacturers of pipe-cutting machinery, have developed a machine and attachment for cutting both straight and tapered threads. This operation has, in the majority of cases, required a lathe, and it is claimed for the new type of machine that it will do

the work in one-tenth of the time. A fuller and more detailed description of the machine will appear in CANADIAN MACHINERY later.

Rousing Sales Meeting.—The Independent Pneumatic Tool Company, general offices, No. 600 West Jackson Boulevard, Chicago, has just completed a very successful sales meeting at which branch managers and representatives from the north, south, east, west, and Canada, were in attendance. The meeting was in charge of Vice-President and General Sales Manager R. S. Cooper; other officials of the company in charge being: John D. Hurley, president; F. W. Buchanan, secretary; Adolph Anderson, assistant to president; F. B. Hamerly, works manager; Axel Levedahl, consulting engineer; and R. A. Norling, C.D.

NEW MITRE BOX PATENT

If you are interested in buying a patent for the latest labor-saving device in mitre boxes, address Box 636, Canadian Machinery. (c22m)

Wanted

A firm of Canadian engineers to manufacture and sell on royalty basis a hand-operated stoker. This is an established appliance, and is the ideal installation for the small plant, where investment cost is an important item. Combustion principles are same as on highest priced automatic stokers. The ideal stoker for the Canadian market, where the one boiler plant is in the majority. Write to Box 632, Canadian Machinery, 143 University Ave., Toronto, Canada.

Wanted by manufacturer of mechanical hot blast heater, good, live agent to represent them in Canada, one calling on foundries and machine shops preferred. Good proposition to right party. Splendid co-operation will be given. Apply Box RG, Canadian Machinery.

PATENTS FOR SALE

Two Canadian Patented Steam Specialties for sale; one Steam Trap, Patent Number 187215, and one Steam Separator, Patent Number 183340.

HACK SAWS AND TOOTH SHAPES

Right down at the bottom of cheaper cutting costs is the shape of the tooth. Years of experiment and actual working tests have given us the "Standard" shape tooth. It 'cuts quicker and lasts longer."

And here's the reason. As a saw is used the points are worn off and the "contact area" of the teeth on the work becomes so great that enough weight to make the teeth "bite" crushes or breaks the blade. In other words, "the saw is dull."

Another thing: In the acute or "positive" angle tooth the leading edge points in the direction of the cut, it's always "digging in" under the surface and most likely to strip. The negative angle tooth simply scrapes off the metal and does not actually cut at all. The hook tooth is under the same handicap as the acute angled tooth. In all unusual teeth the "contact area," the friction producing surface, is greater than with the "Standard" tooth.

The easiest, surest way to get economy in Hack Saws is to use Starrett Blades with the Starrett Chart. Send for Catalog No. 21 "3"

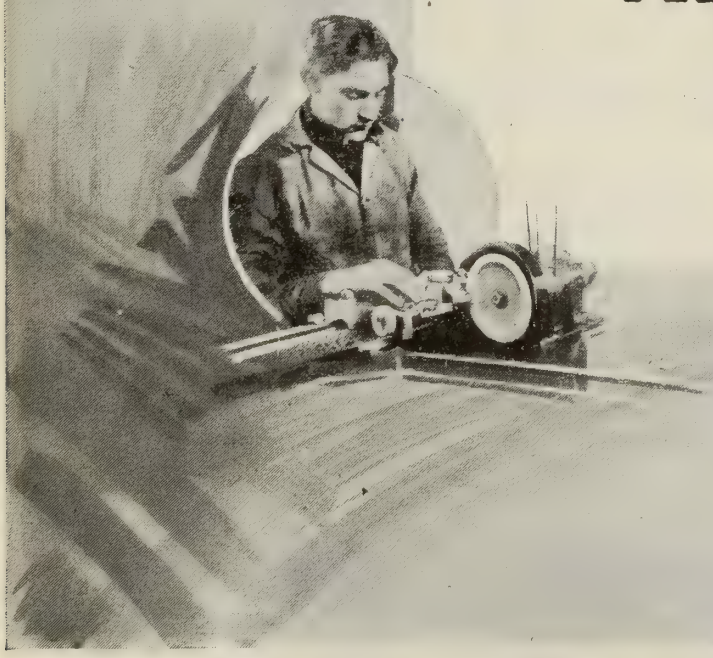
ANNOUNCING THE NEW

ONE OF THE MOST IMPORTANT ANNOUNCEMENTS MADE IN YEARS TO THE USERS OF GRINDING WHEELS IS ON THE NEXT PAGE

IT TELLS ABOUT THE REMARKABLE NEW ABRASIVE

ALOXITE AA



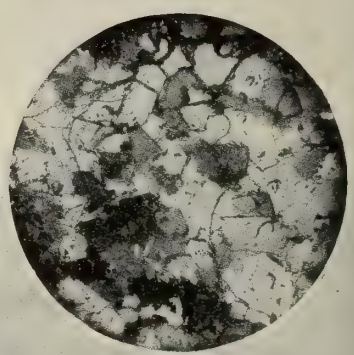


Photo No. 1—Microphotograph showing size of alumina crystals of the ordinary aluminous abrasive. The average diameter is .0027 inch.

THE CARBORUNDUM COMPANY

NEW YORK CHICAGO BOSTON DETROIT CLEVELAND PHILADELPHIA

ABRASIVE ALOXITE AA

FOR some long time the Carborundum Company has felt that industry needed a new abrasive for grinding high-speed steel, case-hardened steel —for the grinding of reamers, cutters, hob mills—for the grinding of certain cylindrical work and for grinding broad steel surfaces where a large amount of stock is to be removed.

Such work called for an abrasive that could be bonded into a wheel that would not only cut cool, but would show marked uniformity in its structure, and would, at the same time, cut grinding costs by producing more work and lasting longer.

The Need Has Been Met and Filled with the NEW ALOXITE AA WHEEL

Aloxite AA is a new aluminous abrasive. It is from 98½ to 99 per cent pure alumina. There are just enough other ingredients, in just the right proportions, to produce a desirable toughness.

One of the most distinctive features of Aloxite AA is the remarkably large size of its crystals. They are much larger than those of the ordinary aluminous abrasive. Because of these big crystals every grit or grain in an Aloxite AA wheel is a definite fragment broken from a larger crystal—and every fragment is keen edged, cutting like a tiny lathe tool, giving the wheel unprecedented sharpness and freedom of cut. Then, too, Aloxite AA Wheels can be made of an open brittle structure yet of a soft grade. This again insures free, clean cutting.

Within the limits of the work mentioned, Aloxite AA Wheels have already, after repeated tests, created a furore among many users of grinding wheels.

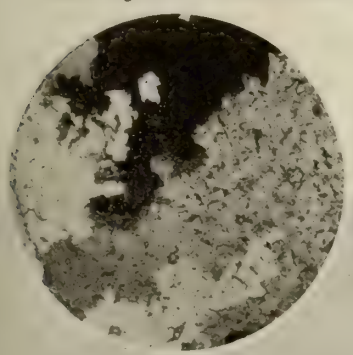

Photo No. 2—Microphotograph showing the large crystals of Aloxite AA. Each area of the same color is one crystal growth. The average diameter is .250 inch, approximately one hundred times larger.

Aloxite AA Wheels are ready right now to come into your plant and demonstrate their truly remarkable grinding qualities.

New Type of Webbed Headstock Insures Great Strength and Rigidity Under All Conditions.

When You Buy a Lathe what do you expect?

Some buy simply because of the name, but the real intelligent buyer goes deeper into the problem.

He wants to feel sure that the material and workmanship is there, together with economy of upkeep. Accuracy must be a strong point in its favor. All these features are combined in every Rae Lathe shipped from our plant.

Rae Machine Tool Works, Limited, HAMILTON ONTARIO

CLINTON CEMENT

Did You Ever See Two Postage Stamps Stuck Back to Back?

Well, that's the way two bricks stick together when our cement is used.

The greatest loss in your furnace efficiency occurs as the result of leakage, cold air pouring in and interfering with proper combustion.

We Have Got This Licked!

Fireclay dries up and sifts out from between the bricks like powder.

But our cement sets and makes a surface like glass yet allowing for expansion and contraction. It sells hot or cold and stands a heat up to 3,000 degrees Fahrenheit.

This cement makes a joint that is stronger than the bricks themselves, and that is itself the strongest part of the whole furnace.

A five-pound tin of **Clinton Super-Heated Cement** will be sent to you free and all charges prepaid, if you write the

GALT - ONT.

Do Your Castings Cost Too Much?

A rearrangement of your patterns might cut their cost 25%; a different method of molding them might double your production at no increase in molding cost. We can advise you and we have expert metal and wood pattern-makers who are able to make any changes that may commend themselves to you.

If you need some new Patterns

send us a sample, blueprint or sketch, and ask for our advice. It won't cost you anything. If our advice is good and commends itself to you, it is only fair to assume that our work will be equally satisfactory, and we need the work as badly as you need the patterns.

We are in a position to do turning, boring, drilling or other semi-finishing operations on castings supplied by us.

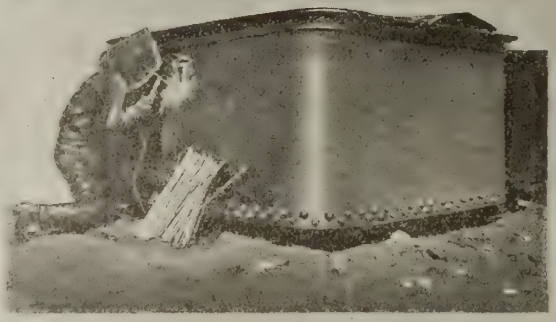
ARMCO IRON WELDING RODS

Welding Submarine Cable with Oxy-Acetylene and ARMCO IRON Welding Rods.



Repairing a Tank with the Electric Arc and ARMCO IRON Welding Rods.

ARMCO IRON is the STANDARD guaranteed welding material

Why experiment with inferior products which endanger the weld and cause loss of time and money?

STEEL AND WIRE — PAGE — QUALITY PRODUCTS

The cost of welding material is insignificant when successful welding, labor, and other items are considered.

ARMCO IRON Welding Rods may cost a trifle more per pound than some other welding rods, *but they cost less per average weld.* There is no waste due to lack of uniformity and no loss of time by the welder. They flow freely and make an even weld which lends itself well to finishing operations.

99.84 per cent Pure Iron Content (minimum) Guaranteed. In uniformity of composition and practical freedom from such foreign matter as sulphur, phosphorus, manganese, silicon, slag, and oxides, ARMCO (American Ingot) IRON actually surpasses the imported welding materials which conscientious welders once considered essential for the best results.

Two kinds of rods of guaranteed ARMCO IRON analysis, one for electric welding and one for oxy-acetylene welding, do all the work (and *better* work) that formerly was thought to require a wide range of welding rods of various analyses.

There are ARMCO Distributors in all principal industrial centers. Our nearest sales office will furnish you the addresses of distributors in your locality.

AMERICAN ARMCO IRON

PAGE STEEL & WIRE CO.

Established 1882 as Page Woven Wire Fence Co.

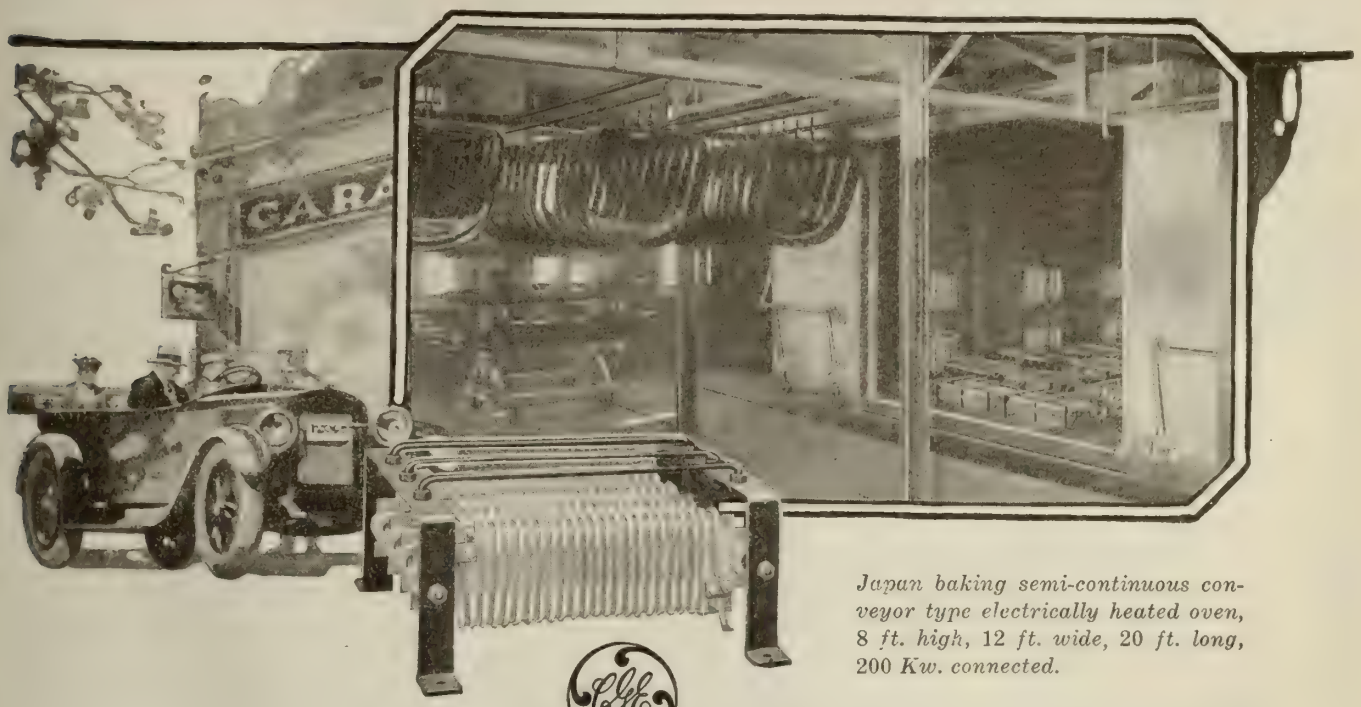
The cheapest method of heating is that which reduces to a minimum the total cost of a satisfactory product.



Japan baking semi-continuous conveyor type electrically heated oven, 8 ft. high, 12 ft. wide, 20 ft. long, 200 Kw. connected.

Japan Baking the Modern Way

MANY of the principal manufacturers of automobiles have installed electrically heated ovens and in all cases great improvement in results has been realized.

Electricity can be used to supplant fuel in practically all heating operations and not only accomplishes better work, but more of it in a given time.

It has been repeatedly demonstrated that the installation of C.G.E. industrial heating equipment will effect many advantages, such as improved quality, increased production, saving in time, elimination of seconds, improved working conditions and reduced fire hazard.

The electric way is the modern way—the proven economical way.

Friction Surfacing Cuts Power Bills

Here is a statement that you can prove to your satisfaction and profit.

Take the meanest drives in your plant—the ones you know are wasting power in slippage on pulleys — ask our belting engineers to specify the correct size of

Dominion Friction Surface Belting

Keep a careful record of those belts for one or two months, or even a year, and compare it with the previous performance of those same drives—then compare *your* power bills for the two periods.

Dominion Friction Surface Belting will prove, in service, every claim we make for it, because the rubber with which it is saturated is a special friction compound that prevents practically all slippage and pays for itself in the power saved.

Our engineers are ready to help you, without charge, increase *your* production and lower *your* cost by making *your* transmission more efficient.

Phone or wire our nearest Service Branch.

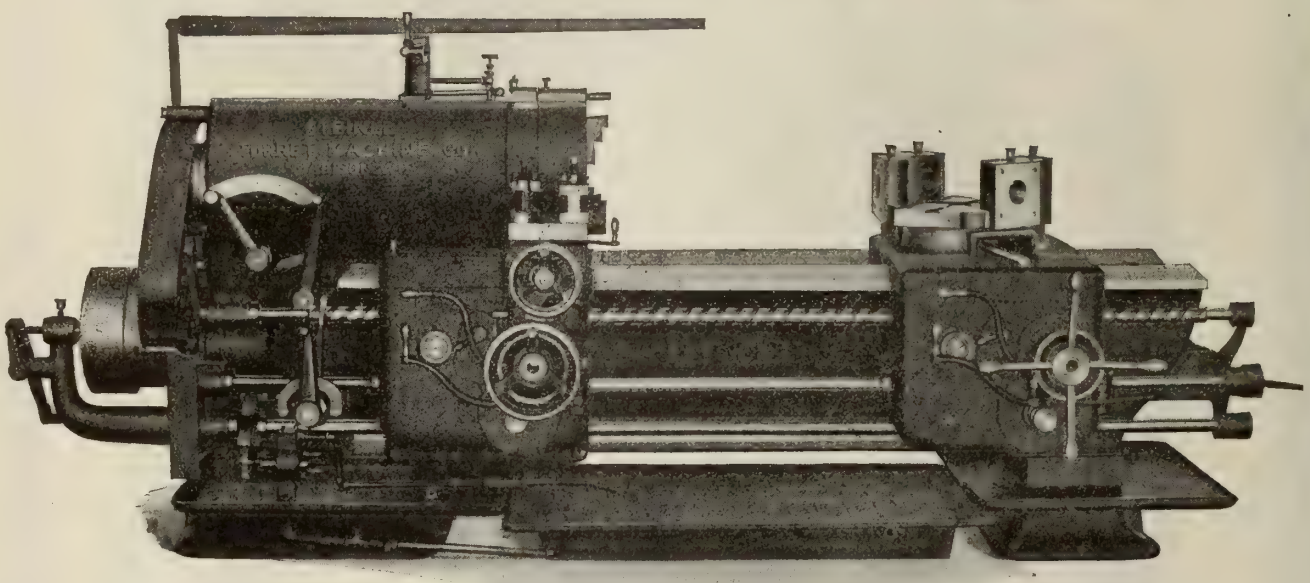
STEINLE



Still another reason why the Steinle 24" Full Swing Side Carriage Turret Lathe is ahead of all others in the economical and accurate production of many classes of work.

THE COMBINATION TURRET

In designing this turret the following points were taken into careful consideration:

The proper manner of supporting different kinds of tool equipment required on a machine of this character.

Avoidance of excessive tool overhang.

Ability to secure the full benefit of the side carriage in relation to the absence of turret tool overhang.

As regularly furnished, the combination turret is hexagon in form, 21" in diameter, and has two open sides and four bored faces. The open sides permit of universal facing heads or similar tool equipment being firmly secured to the bed of the turret and provide for suitable adjustment of tools to the work with a minimum overhang. The bored faces carry drills, boring bars, reamers, die heads, taps, etc.

The combination turret has power traverse and quick change reversible longitudinal feed controlled from the apron.

The bearing on the saddle is the full diameter of the turret. The locking pin is located in front, the greatest possible distance from king pin. One motion of the binding lever releases the pin and turret, or binds same.

The design of the combination turret secures the full advantage of the side carriage feature.

STEINLE TURRET MACHINE CO.

DIAMOND SAW & STAMPING WORKS, 357 Seventh St., Buffalo, N.Y.

Photographic Copying
The PHOTOSTAT

(Trade Mark Registered)

"Orders are now delivered three or four days earlier to our customers by making photographic copies of sketches and drawings which are the same in every detail instead of having our draftsmen reproduce the original.

"Practically all orders were previously held up three or four days by our drafting department while copies of the intricate drawings of ordered tools were being made. Now with the Photostat, only 15 or 20 minutes are required to make the three copies, exact duplicates of the original, which the factory needs to turn out the order. By eliminating this needless delay we are able to provide better service for our customers, and attract new prospects because of prompt deliveries."

This cut shows a PHOTOSTAT on which a large drawing has just been copied in less than a minute.

Never Makes a Mistake

It is simple, practical, easy to handle. Requires no expert knowledge. The machine is loaded with a roll of sensitized paper especially manufactured for the purpose.

The original subject is photographed directly upon this paper producing a facsimile copy which is immediately cut off, developed and fixed right in the PHOTOSTAT itself.

The focusing, exposing and developing are all controlled by simple mechanical devices and no glass plate, film or other intermediate negative has to be made.

After fixing, the copy is removed to a tank of running water and rapidly washed free from chemicals. It is then dried and is ready for use. As many copies as desired may be run off in this manner.

By a simple adjustment of the mechanical focusing device the copy may be made at actual size, reduced, or enlarged, within the size limitations of the machine.

Error in copy is impossible because every copy is an absolute facsimile. The operations are all simple, such as a boy or girl can do.

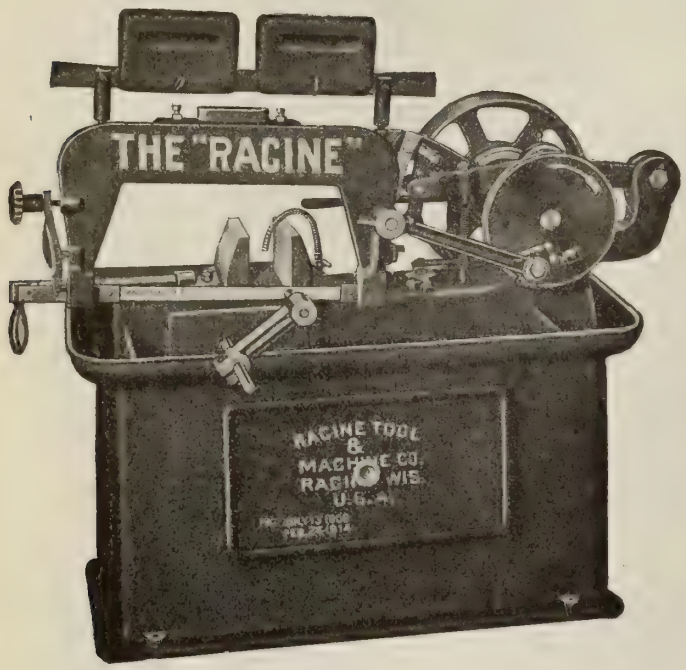
"THE RACINE"



HIGH SPEED METAL CUTTING MACHINE

Reduces Blade Expense

Aside from its ability to turn out more work than any other metal cutting machine, "THE RACINE" will save you considerable money on blades alone—enough to pay for itself in a reasonable time. The automatic lifting device is responsible for that. It automatically raises the blade on the return stroke, relieving it of all dragging or strain. This also means quicker cutting, less power used and greater production.

There are many ways "THE RACINE" will prove a big saving. Let us tell them to you.

Eliminates One Man In Three

A large percentage of the labor in your factory, foundry, warehouse or whatever your plant may be, is employed in **moving material.** From bench to bench; department to department; shop to shop; tank to tank; vat to vat—some men are spending their time conveying your product or some component of it, from one place to another.

By actual test, we have found that an overhead conveyor outfit **saves the wages of one in every three** men who are engaged in this work. A man can move more, move it faster; load it more speedily; unload it more readily, get through his work more efficiently when he has no floor conditions to bother about. Much larger loads are handled at a time with far less work. In these days of high wages, every man saved makes a big difference.

BT Overhead Conveyors

Our regular stock includes certain types of conveyors which we have found of general utility in various plants. In addition our factory is in a splendid position to design a conveyor suited to your special needs. Our track and fittings are adaptable to all conditions and remarkably easy to erect. Just how your plant may be equipped will be cheerfully explained to you if you will express your interest. No obligation attached your written request.

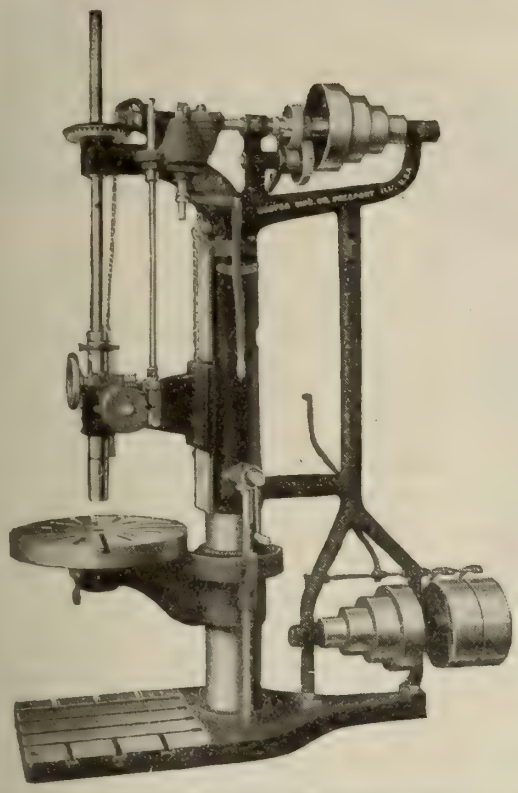
The Driller for Exact Work



HŒFER

Enable Your Workmen to Eliminate Spoilage

The Hoefer Driller is pre-eminently the one to be found in the best plants. "It's almost as good as a Hoefer," so often heard in the machine and tool trade, indicates the position held by Hoefer Drillers.

Exact drilling, to the last thousandth of an inch, pays by eliminating spoiled material. Hoefer Drillers pay for themselves and increase the workman's pride in his work.

Twenty-five Years on Market

Twenty-five years making drillers has given Hoefer the "Know-how." The Hoefer Drillers are used by many of America's leading manufacturers. Equip your factory the Hoefer way. Take any kind of a drilling problem you have to the Hoefer Manufacturing Company, and the Company's experts can tell you how it was solved by other men, some of whom you may know.

Investigate now. Write to-day for catalog. The Hoefer engineers are at your service.

Lacing the Belts of Industry

THE Clipper Belt Lacer is to-day depended upon for keeping belts repaired and moving in 100,000 of the leading industrial plants of the world. Year after year its simplicity, economy and effectiveness have commended it to more plant managers, so that now Clipper Belt Lacing Service has become an institution—a part of the equipment of up-to-date manufacturing establishments.

Less speedy and dependable means of repairing broken power belts would mean, in a big plant, incalculable loss. Antiquated methods that take from fifteen minutes to half an hour to repair a joint are too expensive for **any** plant.

The Clipper Belt Lacer Laces a Belt in Three Minutes

Besides mending a joint quickly, the Clipper does the job well. The belt is permanently repaired. It is smooth and flush on both sides, pulls as it should, and is safe. A Clipper-laced joint strengthens the belt at a weak point.

The Clipper lacing tool is so simple that any shop workman can use it. No experts required. The cost of mending belts with the Clipper is negligible.

Your plant may to-day be using Clipper Belt Lacing methods, but may not be equipped with a sufficient number of Clipper tools.

Most big plants make their Clipper service 100% efficient by keeping Clipper tools convenient to every battery of machines for emergency use when a belt breaks.

The American Museum of Safety has expressed its opinion of the Clipper Belt Lacer by awarding it the only gold medal ever given for metal lacing.

To manufacturers who have not had satisfactory belt repairing service, the Clipper is recommended with confidence. It goes to them on free trial and is backed by a permanent guarantee.

The Clipper is sold by mill supply houses. European Trade supplied through London Office Distributors in all parts of the world.

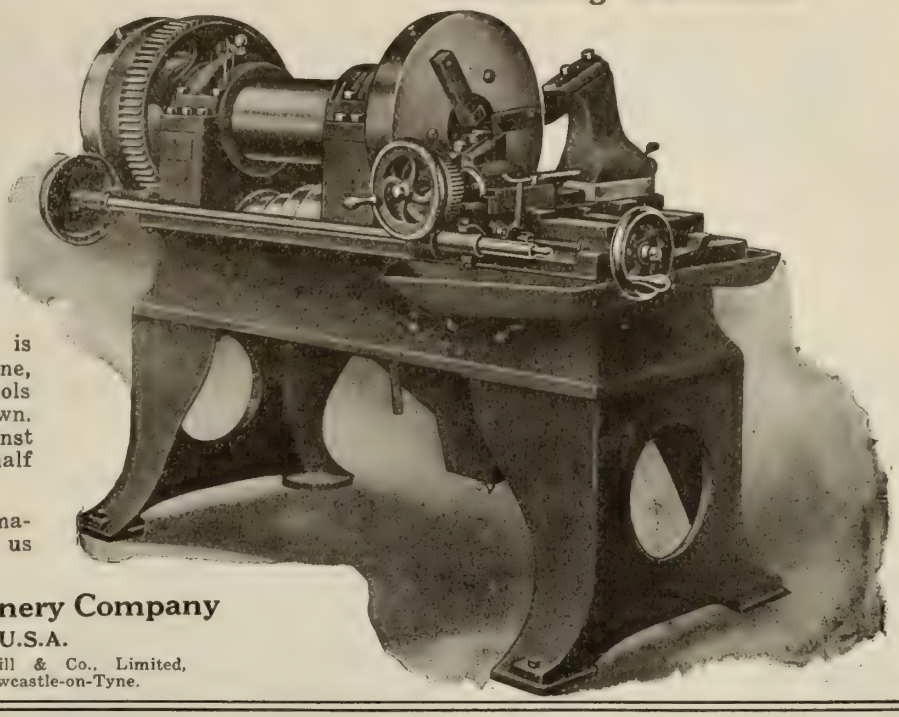
Cut Your Cutting-off Costs in HALF

HURLBUT'S

Patent Cutting-off and Centering Machines



TO say that the Hurlbut, Rogers Cutting-Off and Centering Machine will **double your production** and **cut your costs in half** may seem like a broad claim. But this is just what this machine will do compared with any ordinary machine of its kind.

Hurlbut, Rogers speed and efficiency is easily explained. Instead of only one, it is equipped with two cutting-off tools —one cutting up and the other down. In this way they hold the work against each other and finish a job in just half the time and do twice the work.

You can't afford to be without this machine. It saves real money. Let us tell you more about it. Write!

Gear Cutting With The "IFS" Left Out

The Gear Shaper Way

A production manufacturer knows that he will secure good gears IF he has an accurate cutter, an accurate machine and a machine working on the correct principle. The whole question of good gears is resolved in this one little word "IF."

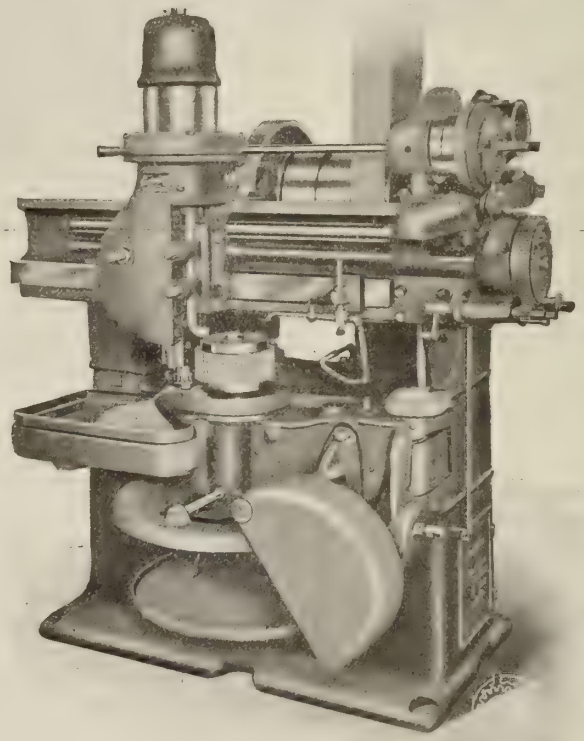
When the Gear Shaper was originally designed, the question of "IF" was taken into consideration and every possible means known to mechanical engineering was employed to eliminate the "IFS" from gear cutting.

That we have been successful in solving the problem is evidenced by the fact that each ensuing year sees a larger number of manufacturers adopting the Gear Shaper method.

How the Gear Shaper has accomplished this is clearly explained in our general catalog "Commercial Gear Cutting," which is a treatise on the subject of:—

Gear Cutting with the "IFS" Left Out.

Send for your copy to-day.



The Fellows Gear Shaper—the machine which has taken the "IFS" out of gear cutting.

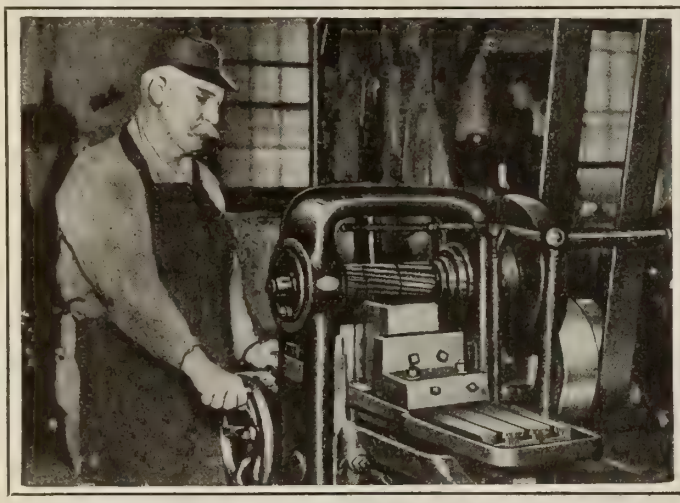
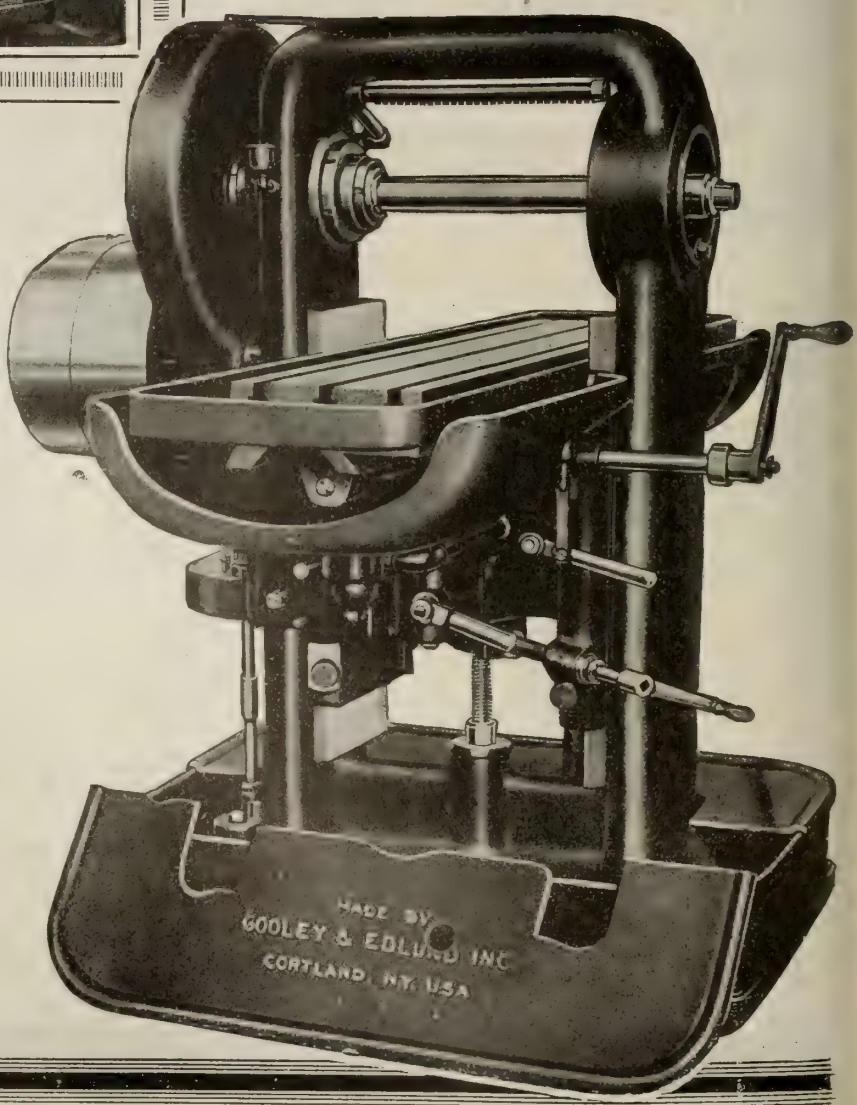
A. R. Williams Machinery Company, Ltd., 64 Front St. West, Toronto.

BRIGGS MILLER



Keeps Five Die Sinkers Going



HERE you see the Briggs Miller Squaring Die Blocks, and it is working so fast it keeps five die sinkers going.

Some are new, squared from the rough; some are old, annealed, cut down and made over; some are oblong, some square, in sizes up to 9 inches. This Briggs Miller has been squaring blocks for four years; has never given any trouble. When cutters get dull the operator has another gang ready to go on with the work. Unusual rigidity accounts for Briggs' higher efficiency.

Don't you think you could use this tool to advantage in your shop? Write for the details.

Gooley & Edlund, Inc.

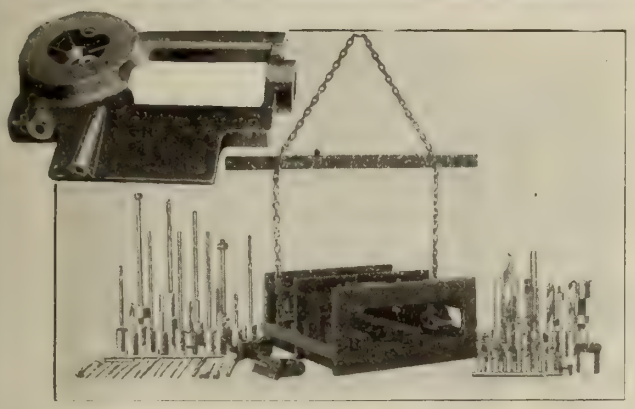
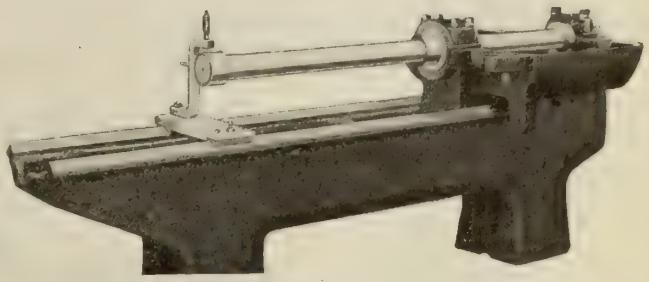
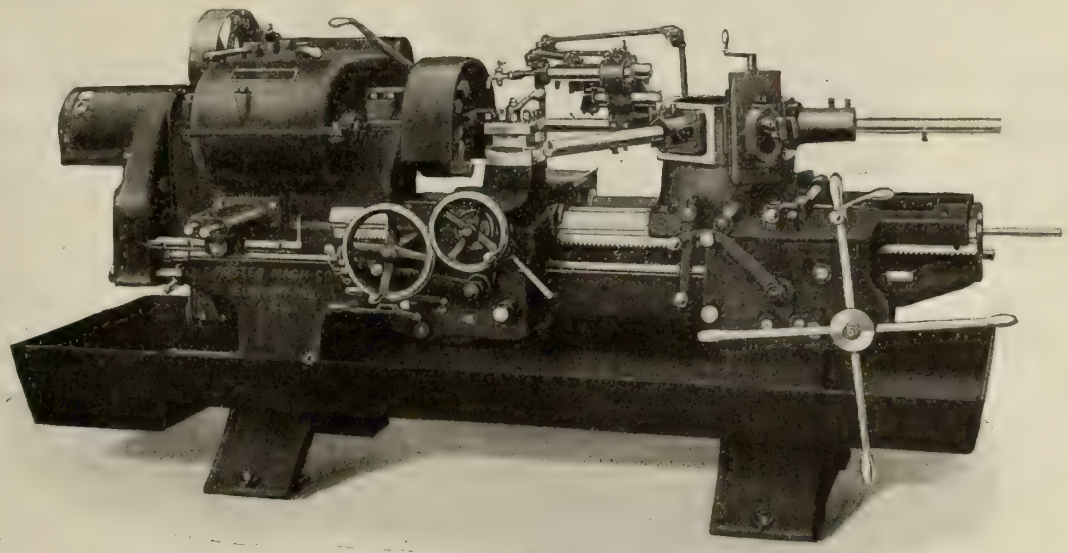
Garlock Walker Machinery Co., Ltd.
Toronto, Ont.

Williams & Wilson, Ltd., Montreal







THE HIGH COST OF A BREAKDOWN

Ask your chief cost clerk how much that breakdown cost you in dollars and cents. He will tell you that the operators' wages amounted to so much; the machine charges so much; floor space so much and general overhead so much.

But your factory superintendent will tell another story: He knows that the breakdown of a machine is liable to throw the continuity of flow of production entirely out of gear. The machine performing the second operation on the piece may have to stand idle for lack of work while the breakdown is being repaired. The assembling department may have to slow down from lack of finished parts.

QUALITY IN A MACHINE TOOL IS AN INSURANCE AGAINST BREAKDOWN.

You buy quality when you buy a Foster Universal Turret Lathe.

Quality means that—

1. The design of the machine is correct.
2. The right material is used for each individual part in the machine.
3. The workmanship entering into the building of the machine is of high character.
4. The proper heat treatment is given to all parts requiring such.
5. Every machine is inspected and tested thoroughly before leaving the factory.

We have a booklet entitled "FOSTER QUALITY," descriptive of our methods and equipment. It will interest you.

Write for it

FOSTER MACHINE CO., ELKHART, IND.

THE BICKNELL-THOMAS TAPPING ATTACHMENT

Fits Any Make Drill

A friction mechanism inside the body of the attachment is automatically adjusted by the driving pressure, creating a very sensitive drive and eliminating the sudden strain of the reverse—responsible for many broken taps. This attachment is fitted with a plain chuck with jaws that grip both the round and square end of the tap shank.

Made to take taps from 3-32" to 1-4" in diameter.

Can you Forget?

AS long as you live you'll remember November 11th, 1918—Armistice Day.
That was the day the enemy surrendered.
That was the day of Victory for our army.
Day after day—year after year—through rain, cold, heat, mud, death—they had fought bravely, stubbornly, cleverly, faithfully—the spearhead of fate pointing inexorably at the black heart of the enemy.

REMEMBER the Somme? Ypres? Vimy? Passchendale? Cambrai? MONS?

Can't you catch this brave spirit?

Can't you see how small is our task compared with theirs?

Shall we fail to lend our money to the country for which they gave their lives?

The Victory Loan 1919 must be a victory, too. It is needed to pay our obligations to the army and to keep the fair name of Canada writ high among the nations.

This is a War Loan!

Canada needs to borrow your money!

If the Victory Loan succeeds it will be another Mons for Canada!

Let us show the world again that what Canada undertakes Canada accomplishes

Satisfactory

OUR 16-INCH PLAIN MOTOR DRIVE LATHES

HAVE PROVEN A GREAT SUCCESS

They are very simple in operation, have no overhang. They have almost the power of a geared head. They are compact and rigid, powerful and efficient. They are accurate and economical and very satisfactory.

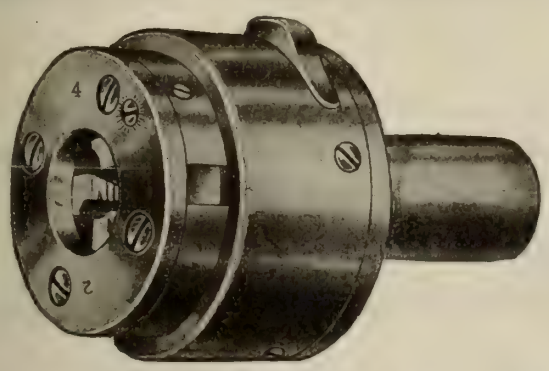
We want you Canadians to install

The Lathe with the Pull
The Lathe of Satisfied Accuracy

Make them pay for themselves, as they will. We build 14-inch belt drive, 16-inch belt and motor drive, 18-inch belt and motor drive, geared head or plain, 20 and 24-inch belt and motor drive, geared head or plain.

THE CISCO MACHINE TOOL CO.

CINCINNATI, U.S.A.



H & G Die Heads

are of small outside diameter compared with the size of work they do.

The H. & G. illustrated is an automatic, self-opening Die Head designed especially for use on Gridley and National Acme Multiple Spindle Screw Machines and others that use the die in a revolving position. The four sizes of this Head cut up to 9/16", 1", 1¼" and 1½".

All parts are hardened and ground and interchangeable. In a word—it's an H. & G.

Why use makeshifts?

WHY waste time and energy with makeshift devices for boring operations when Williams' "Agrippa" Adjustable Boring-Tool Posts offer convenience and efficiency developed to the nth power?

Each post accommodates a wide range of Bars, the height of which is readily adjusted; a turn of the Knurled Ring raises or lowers the base on which they rest. The whole device is instantly and rigidly locked by tightening the Set Screw.

Four sizes for ½ to 2¼" diameter Bars—furnished with or without Bars.

FRANKLIN DIE-CASTINGS

Fast and Accurate Duplication at Low Cost

Eliminating the excessive cost of machined parts has been our work for twenty-seven years.

Thus the scope of Franklin Die-Castings has widened, their utility in many industries has been demonstrated, and a great and growing industrial economy accomplished.

We cast in aluminum, zinc, tin and lead base alloys. Bearings and hard metal parts. Quantity deliveries assured.

Write for our Booklet "C." Send sample of part, or blue print, and we will promptly make estimate and recommendation.

Your Money's Worth

Never again will the Canadian Nation and People be the same careless improvident spenders of "ante bellum" days. "EFFICIENCY" and "GET YOUR MONEY'S WORTH" will be the popular motto and the successful machine shop manager must be able to see the advantage of making one pound of High Speed Tool Steel do the same work as ten pounds in forged tools; in other words he must and will

USE ARMSTRONG TOOL HOLDERS

No heavy "stub-ends" to throw away. No time lost with men at the grinder while lathes stand idle. No stock of heavy sizes of steel to carry, and the blacksmith as a tool-dresser is eliminated entirely.

Armstrong Tools are great favorites with the men—a good thing to consider from a production standpoint.

Our Catalogue is of handy pocket size and will be mailed to you upon request

ARMSTRONG BROS. TOOL CO.
"THE TOOL HOLDER PEOPLE"
306 N. FRANCISCO AVE. CHICAGO, U.S.A.

Files That Stay Sharp

Workmen know it is better to throw away a file as soon as it becomes worn. They can't get good results from dull files.

Do not be afraid to tell your workman to discard a Famous Five File as soon as it becomes dull. You will have obtained the maximum service before its usefulness is gone.

Famous Five Files are hardened by a special process which increases their durability.

Specify them when ordering.

They are:

General Efficiency Demands the Use of

BERNARD
Wood Split Pulleys

The war is ended so far as a continuation of the bloody combats of the battlefields is concerned. But in the war after the war there will be waged lively battles for industrial supremacy wherein the advantage will lie with the plant equipped with the most economical and durable machinery.

Competition will be more intense, and in this connection, keep your eye on the overhead. It has been looming large these past few years and must certainly come down.

BERNARD Wood Split Pulleys will help you eliminate power waste; their cost is low, their efficiency is GREAT.

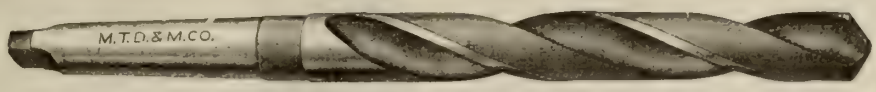
IT GOES WITHOUT SAYING



WHEN YOU SEE THE NAME **"MORSE"** YOU INSTINCTIVELY THINK OF

TWIST DRILLS

BUT WHY STOP THERE? WE ALSO MANUFACTURE

REAMERS, CUTTERS, CHUCKS, ARBORS, TAPS, DIES, COUNTERBORES, MANDRELS, COUNTERSINKS, GAUGES, SCREW-PLATES, SLEEVES, SOCKETS, TAPER PINS, WRENCHES, ETC.

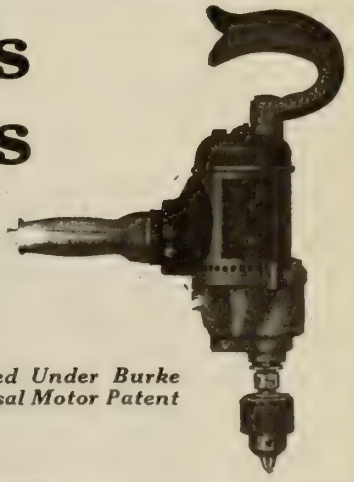
IN ALL OF WHICH THERE IS THAT SAME

HIGH QUALITY AND STANDARD OF EXCELLENCE

Morse Twist Drill & Machine Company
New Bedford, Mass., U.S.A.

Thor

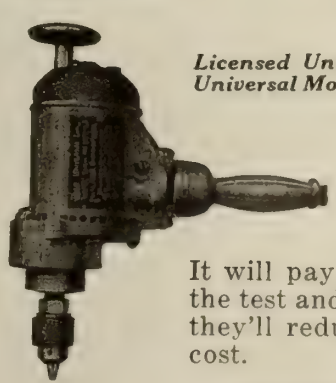
Electric Drills and Grinders



The only Electric Tools equipped throughout with ball and roller bearings.

Light, Powerful and Durable.

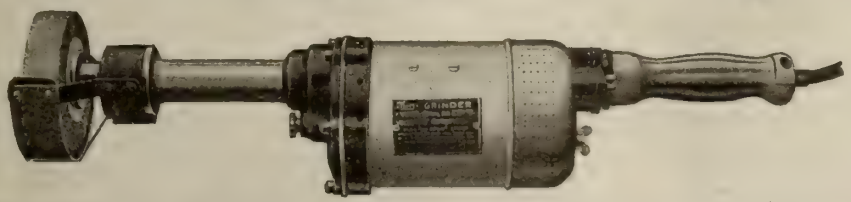
Thor Electric Tools have off-set spindles —which permit operating in close quarters—a variety of speeds, S K F Ball Bearings, four contact switches, D.C. or Universal Motors and several other features that make them the super-tools of the day. Jacobs Chucks used as Regular Equipment.



Licensed Under Burke Universal Motor Patent

PORTABLE ELECTRIC GRINDER

Equipped with Universal Motor for Operating on Direct or Alternating Current 110 TO 250 VOLTS



It will pay you to put them to the test and let them prove that they'll reduce your production cost.

3 Minutes to Drill 20 Holes

That makes a total of 20 Cylinder Blocks (400 holes) drilled every hour. We really should say "Multi-Drilled," for that is why this output is possible.

A Motor Driven NATCO is doing it in the plant of the Harroun Motor Car Company, Detroit—and thereby making the day 20 times as productive; the entire 20 holes are drilled at the same time. One hole at a time method would not only take 20 times as long, but would require 20 men and 20 machines.

As many as 72 holes, of various sizes, can be drilled, tapped, reamed, spotfaced or counterbored at the same time. The NATCO patented feaure—Independent Change of Speed for each Drill—provides the approximate correct speed for each size tool.

Shall we give you production estimates on your work?
Simply send us blueprints.

We also design and build jigs and fixtures for use in connection with NATCO Multi-Drillers.

The National Automatic Tool Company
Richmond, Indiana, U. S. A.

List of NATCO foreign agents:

Burton, Griffiths & Co., British Isles.
E. Isbecque & Co., Belgium.
Allied Machinery Co. of America, Italy, Spain, Portugal and Switzerland.

Don't "Leave it to George"

Canada was never lacking in war enterprise—war strategy—war efficiency. She always carried out successfully her plans of war.

Now—we must apply the same determination and energy to the plans of peace, for we now have new problems to solve.

We are faced with the great work of readjusting our country from a War to a Peace footing.

Our immediate duty is to provide the national working capital, without which it will be impossible to carry out the Plans of Peace.

Demobilization, bonuses to soldiers, civil re-establishment, credit loans to Britain for the purchase of Canadian surplus products, ensuring continued employment to our workers. All these call for national capital, and the Victory Bonds 1919 will provide that capital.

Therefore, the success of the Victory Loan is not something that concerns "the other fellow" only.

You have a part to play.

Your individual prosperity is at stake.

YOU must support the Victory Loan just as enthusiastically as your fellow citizens.

Canada must have the money to carry out the Plans of Peace.

If things are to be kept "humming" you must

BUY VICTORY BONDS

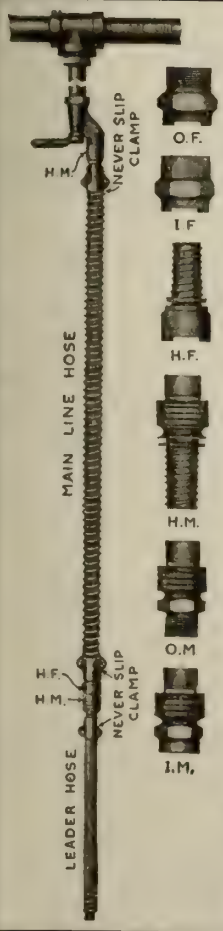
THIS SPACE DONATED TO THE VICTORY LOAN 1919 CAMPAIGN BY

DOMINION FOUNDRIES AND STEEL, LIMITED

HAMILTON, CANADA



CLEVELAND HOSE SPECIALTIES

Bowes Automatic Air Hose Couplings

Standard Equipment Everywhere

STYLE O.F. is an Outside Thread Female Pipe End. Made in sizes ⅜-inch to 1½-inch.
STYLE I.F. is an inside Thread Female Pipe End. Made in sizes ¼-inch to 1½-inch.
STYLE H.F. is a Female Hose End with spiral shank to insert into the hose and has groove for the Never Slip Hose Clamp. Made in sizes ¼-in. to 1½-in.
STYLE H.M. is a Male Hose End with spiral shank to insert into the hose and has groove for the Never Slip Hose Clamp. Made in sizes ¼-in. to 1½-in.
STYLE O.M. is an Inside Thread Male Pipe End Made in sizes ¼-in. to 1½-in.
STYLE I.M. is an Inside Thread Male Pipe End. Made in sizes ⅜-in. to 1½-in.
The Male and Female Ends of Bowes Couplings interchange in sizes ¼-in. to ¾-in. Sizes 1-in. and 1¼-in. interchange. The 1½-in. ends interchange only with themselves.

BOWES COUPLINGS

Are instantly connected or disconnected.
They are absolutely air-tight under all pressures.
They quickly pay for themselves by stopping costly leaks.
They interchange in sizes most commonly used.
They have no loose parts to be mislaid or lost.
They are made of brass and will not rust.
The U-shaped Gasket interchanges in couplings ¼-inch to ¾-in.

The Cleco Never Slip Hose Clamp

Made in same sizes as Bowes Couplings

The adjoining cut of Cleco Never Slip Hose Clamp shows the "Flanges" which engage the groove provided in all hose ends of Bowes Couplings. The "Model Hose Line" illustrated shows correct styles of couplings and valve to use and proper way to attach the clamps.

CLECO GROOVED HOSE NIPPLE

Grooved Nipples when attached to hose with the wire clamp cannot "blow-out," as one-half of the Wire Clamp lies in Nipple Groove, and the other half on the hose, uniting nipple and hose permanently.

WIRE CLAMP TOOL

To apply Wire Clamps to Grooved Hose Nipples you need the Wire Clamp Tool illustrated, a small hand-operated tool at moderate cost which we carry in stock for immediate delivery. In Stock: Riveting and Chipping Hammers, Four-piston Air Drills, Corner Drills, Emery Grinders, Sand Rammers, Holder Ons, etc.

Use Annealed Wire No. 14

Write for Bulletin 38 illustrating Cleco Hose Fittings, Couplings, Valves, etc.

IMPORTANT:—The Small Leaks in your "AIR LINE" mean serious loss in DOLLARS. Have you any idea of the amount of "Air" wasted in small leaks at your connections? Air Leakage through 1-16 in. opening equals 5.32 cu. ft. per minute at 80 lbs. It will pay you to install Bowes Couplings and stop costly leaks.

Write for Bulletin 34A, 41 and 43.

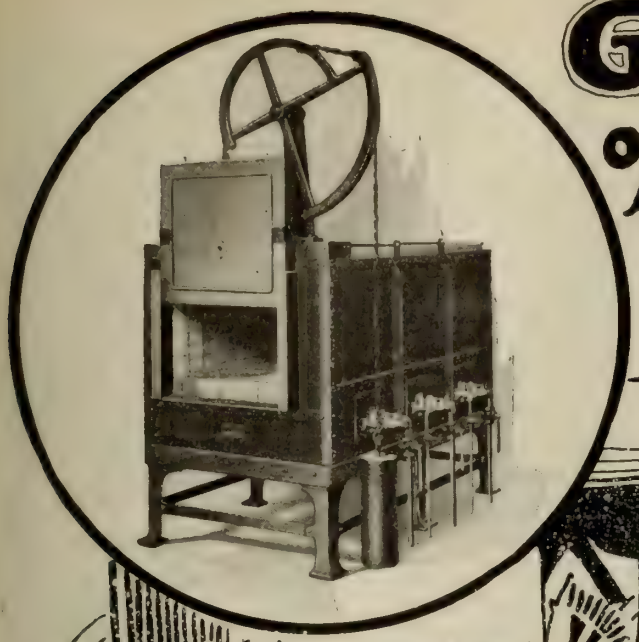
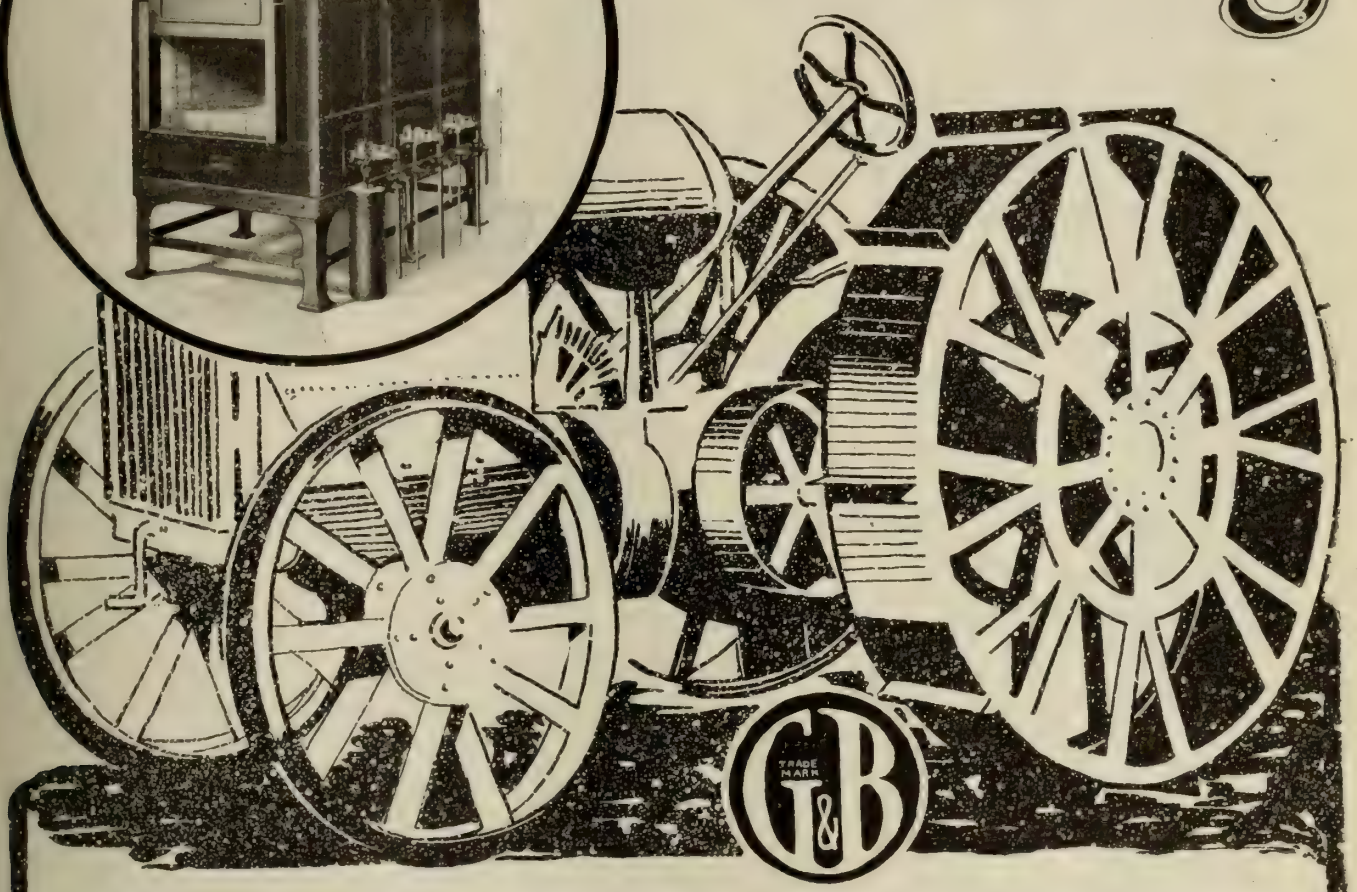
G&B Method of Heat-Treating





Gilbert & Barker Method the Right Method of Heat-Treating

Used by the Largest Manufacturers of Autos and Trucks.

Whether you manufacture tractors—automobiles —trucks—crankshafts—camshafts —tools—machine parts or anything else that requires heat-treating unless you have the **right** kind of heat-treating furnace for the purpose, you are defeating your own purpose, that of turning out a first-class product of uniform high quality.

GILBERT & BARKER FURNACES INSURE
PERFECT COMBUSTION—ABSOLUTE TEMPERATURE CONTROL
UNIFORMITY OF HEAT

the result of which is an exceptionally high grade product which measures up to the best manufacturing standards. There is a G. & B. Furnace exactly suited to your requirements. Let our engineers advise you—write. **To-day is a better day than to-morrow to send for Bulletin 24.**

Heat Under Accurate Control

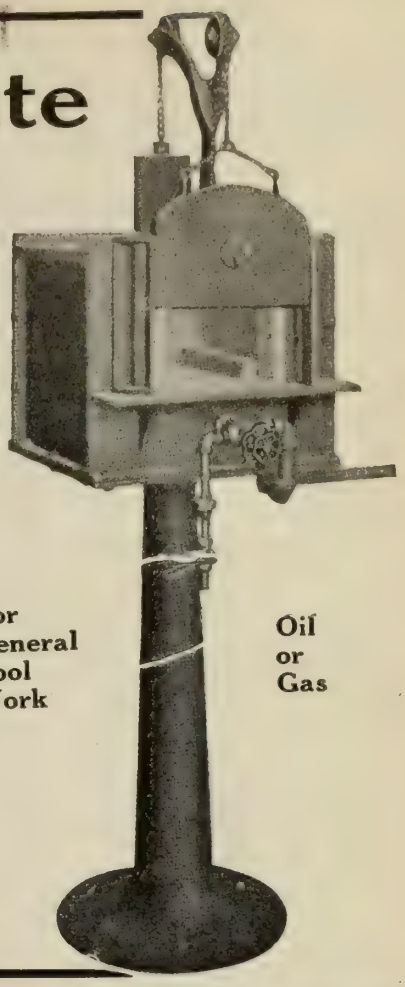
Here is an important factor in the heat treatment of metals. An intense heat, rapidly developed, and always under accurate control of the operator, are features that distinguish

BELLEVUE FURNACES

These tool forges are particularly adapted for the requirements of the small machine shop for annealing and tempering dies, cutters, reamers, etc.

Combustion is perfect and no flames come in contact with material. Built to stand the highest temperature. Doors are properly counterbalanced. In every way BELLEVUE FURNACES meet with the demand for durability, efficiency and convenience.

Let us advise you about your heat-treating problems.



For General Tool Work

Oil or Gas

Bellevue Industrial Furnace Company

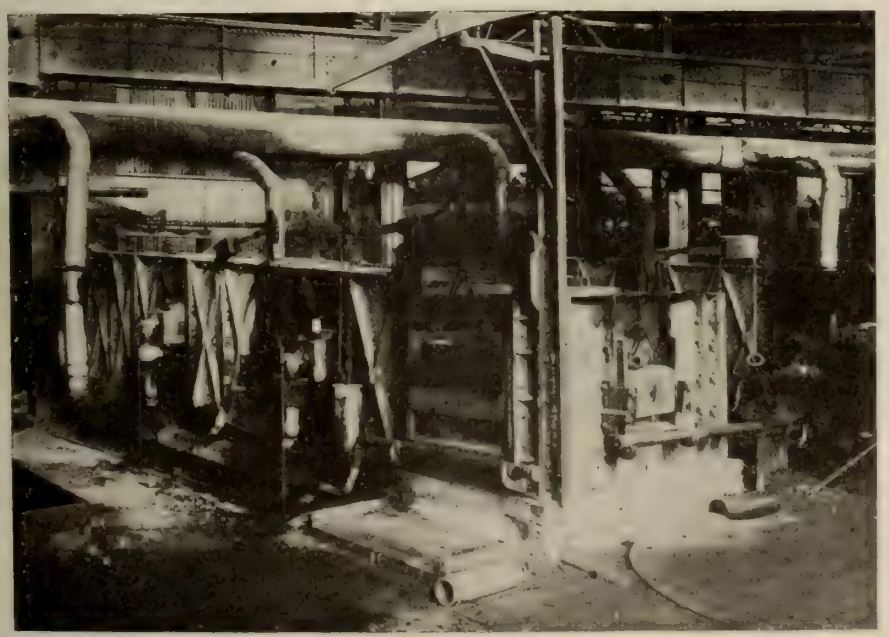
Julius C. Hinz, President

703 Bellevue Ave. - Detroit, Mich.

Representatives in Canada: H. W. PETRIE, LIMITED, Toronto, Canada

Another MECOL Furnace

demonstrated its superior features point by point to a group of men whose years of experience in the heat-treatment of metals made them appreciative judges. We refer to the "Mecol" Furnace shown in this illustration, installed at the Pointe St. Charles Works of the Canadian Steel Foundries, Limited.



Our intimate knowledge of heat-treating methods, and our long experience in the building of efficient furnaces fit us to give helpful advice—and that we will do promptly if you

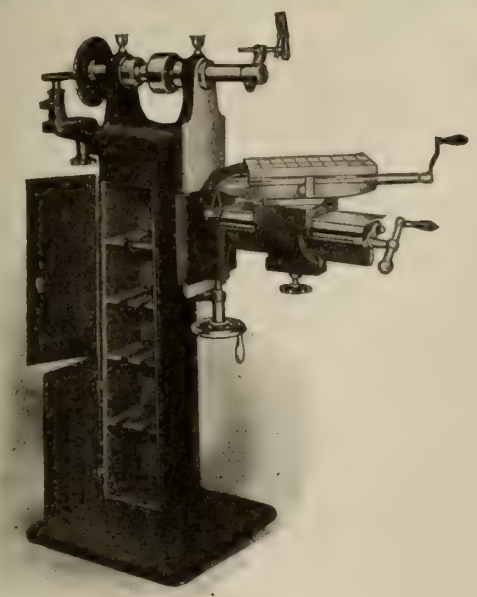
OBTAIN THE BEST RESULTS



GARVIN No. 3, Universal Cutter and Surface Grinder
Use Code—Banish

From Cutters and Tools Kept Sharp on

GARVIN No. 3 UNIVERSAL

CUTTER AND SURFACE GRINDERS

Simple Light Running Accurate

The spindle is hardened and ground and supported out close to the wheel by an extended bearing, and carefully protected from emery.

The knee and the yoke carried on the knee both have a large range of adjustment. On the knee yoke or carriage is mounted the swiveling table, which has a quick, sensitive movement by rack and pinion operated from end or side.

On this table is mounted the index head, and all the attachments are held in this head.

An outfit of emery wheels, mandrels, bushings, wrenches, etc., is supplied with the machine.

Machine is designed to keep its original factory accuracy.

CAPACITY: CUTTERS, 14″ x 6″; SURFACES, 9½″ x 6″

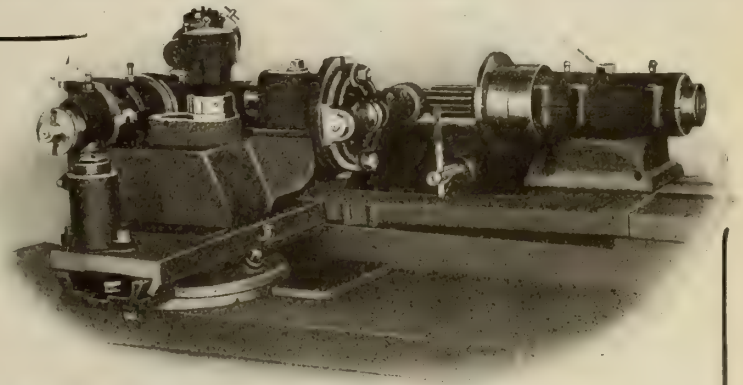
Manufactured by

THE GARVIN MACHINE COMPANY

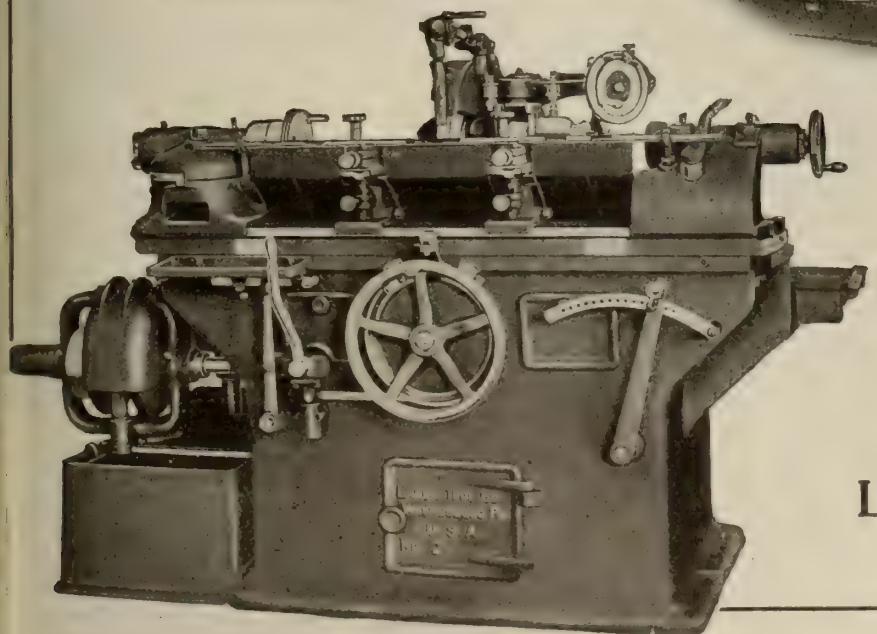
Spring and Varick Streets ***(Visitors Welcome)*** **50 Years New York City**

Easy to Operate

Landis Universal Grinding Machines



Backing-off Straight Reamer



Their application is practically unlimited, combining, as they do, both an external and internal grinding machine.

Besides they are economical, and increased efficiency can be obtained by the use of the magnetic chuck, side mill grinding attachment, gear cutter grinding attachment, etc. (See sketch herewith).

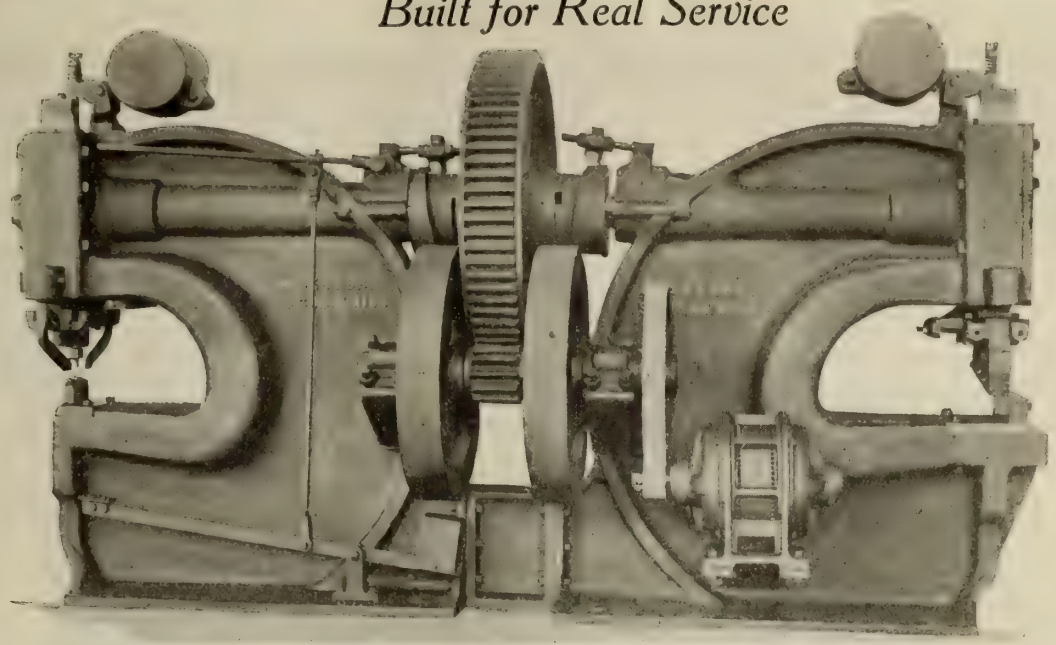
WICKES' Heavy Duty Double Punch

Built for Real Service

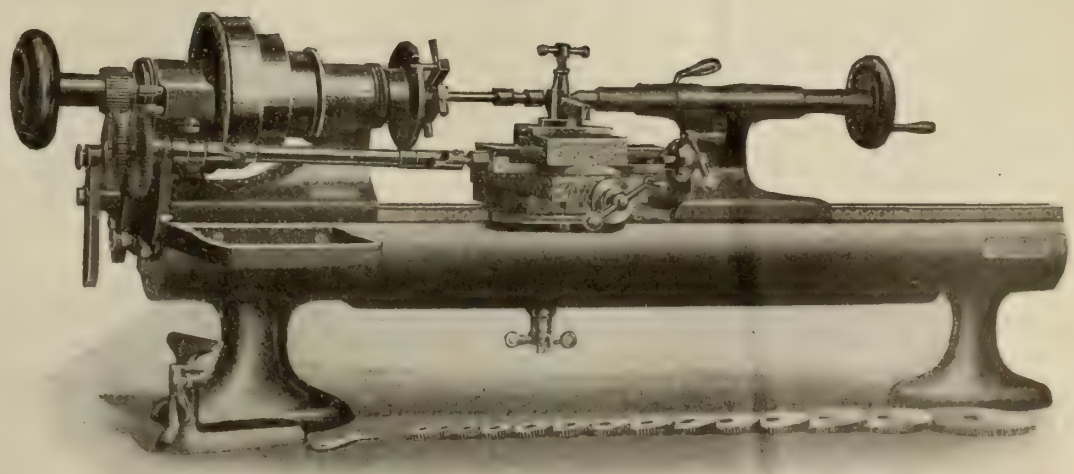


We also manufacture High Grade Horizontal and Vertical Rolls, Angle Rolls, Single Punches, Shears, Spruce Cutters Radial Wall Drills or Counter-sinking Machines, Flanging Clamps and Heavy Duty Engine Lathes. *Ask for Catalogue.*

WICKES BROS., SAGINAW, MICH., U.S.A.

CATARACT BENCH LATHES AND ATTACHMENTS

Cataract Bench Lathes are finely constructed precision tools, with responsive controls, simple adjustments and numerous convenient attachments adapting them to a wide variety of work. **Study this illustration.** Note the base, the circular bed, the sliding tool post, massive head stock (indicating strength), range of gears, special tailstock, arrangement of gears.



Hardinge Bros., 1770 Bertau Avenue, Chicago, Ill.

ALFRED HERBERT CO., Limited, Coventry, England, are our representatives for United Kingdom, France, Belgium, Russia, Japan, Manchuria, Korea, Formosa, China, Italy.

A Shop Is Rated On Its Equipment

Tools are the foundation of a shop. A well equipped tool room is the basis for high grade work.

The shops that are recognized for their high standards of accuracy are the places where you find the tool rooms equipped with reliable

Brown & Sharpe Machinists Tools

Brown & Sharpe Mfg. Co.

Providence, R.I. U.S.A.

You Need a Good Die Stock Set

if you need one at all.

Because a **GOOD** Die Stock Set embodies:

1. Accuracy in its product.
2. Adjustment for wear.
3. Free cutting qualities.
4. Provision for sharpening.
5. Ample adjustment for oversize or undersize.

P. & W. Die Stock Dies **ARE GOOD DIES.**

BETTER than most because of the interchangeable feature in their chasers. A broken chaser in a P. & W. Die doesn't mean a new set of chasers. You can get a new chaser to replace a breakage and the new one "fits in" perfectly in your old set. That's the 6th point **"ECONOMY IN OPERATION."**

MILWAUKEE MILLING MACHINES

Double Overarm maintains alignment.

It is impossible for the operator to place the arbor supports on the arbor and double overarm in any other way than in line. Arbor cannot be pounded out of line when using large, coarse pitch cutters on rough, heavy work.

Other Distinctive Milwaukee Features:

Solid top knee—hardened steel gearing and shafts in the column and feed box—automatic flooded lubrication — one and one-half gallons of oil per minute pouring over all gears and bearings in the column and feed box, insuring lubrication at all times—flanged spindle with hardened steel collar for driving arbors—constant speed drive, reverse being self-contained.

Send for our No. 21 Catalogue. Illustrating and describing Milwaukee Milling Machines and accessories in detail

ANNOUNCEMENT

THE ALGOMA STEEL CORPORATION, LIMITED, take pleasure in announcing to their customers and the Canadian trade that in accordance with the widespread desire throughout the Dominion that there should be obtained in Canada with Canadian labor, a much larger proportion of the requirements of this country in STEEL SECTIONS for STRUCTURAL PURPOSES, CAR CONSTRUCTION, SHIPBUILDERS' REQUIREMENTS, etc., they are just completing extensive alterations and additions to their rolling mills, and on or about 1ST NOVEMBER, will be ready to produce and ship American Standard Sections of BEAMS and CHANNELS up to and including 15″, all standard sections of ANGLES from 6″ x 6″ down to 1¼″ x 1¼″, ZEE BARS for car builders and general purposes, small and large ROUNDS and SQUARES, and FLAT BARS up to 14″ wide. The quality of the product is already well known to the trade, and is exclusively steel made by the Open Hearth process. and can be furnished in all grades from the softest rivet stock to high carbon special spring material.

MARK OF ALGOMA O.H. QUALITY

The following are the sections which will be rolled:---

ANGLES—Equal Leg—
6 x 6″—5 x 5″—4 x 4″
3½ x 3½″—3 x 3″
2½ x 2½″—2¼ x 2¼″
2 x 2″—1¾ x 1¾″
1½ x 1½″—1¼ x 1¼″

ANGLES—Unequal Leg—
6 x 4″—6 x 3½″—5 x 4″
5 x 3½″—5 x 3″—4½ x 3″
4 x 3½″—4 x 3″—3½ x 3″
3½ x 2½″—3 x 2½″—3 x 2″
2½ x 2″

BEAMS—
15″, 12″, 10″, 8″, 6″, 5″, 4″, 3″.

CHANNELS—
15″, 13″, 12″, 10″, 8″, 6″, 5″, 4″, 3″.

ZEES—
3¼ x 5 x 3¼ x 5/16
3 5/16 x 5 1/16 x 3 5/16 x ⅜″
3⅜ x 5⅛ x 3⅜ x 7/16″
3 1/16 x 4 x 3 1/16 x ¼″
3⅛ x 4 1/16 x 3⅛ x 5/16″
3 3/16 x 4⅛ x 3 3/16 x ⅜″
2 11/16 x 3 x 2 11/16 x ¼″
2¾ x 3 1/16 x 2¾ x 5/16″

ROUNDS—
All sizes from ½″ up to and including 4″.

SQUARES—
All sizes from ½″ up to and including 3″.

FLATS—
All sizes from 1 x ¼″ up to and including 14″ wide.

MINE RAILS—
All sections from 12 lbs. up to and including 45 lbs. per yard.

PIG IRON—
Machine cast FOUNDRY MALLEABLE and BASIC.

SULPHATE OF AMMONIA.
NITRE CAKE.

For the better convenience of customers who may find it necessary to secure rush shipments of particular items, they contemplate keeping a large stock of all the various standard sections constantly on hand, and to this end extensive warehouse facilities are being prepared.
Your enquiries and business will be appreciated.

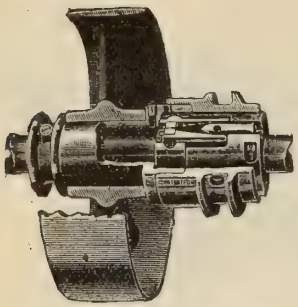
THE JOHNSON FRICTION CLUTCH



Standard Single Clutch with Pully Mounted on Hub —Clutch Engaged.

MANUFACTURERS who are particular about keeping an established reputation equip all their machines with Johnson clutches. They recognize that superiority must be consistent in order to count. And Johnson clutches assure them of uniformly good service wherever they are installed.

Other clutches might work well in some cases—but Johnson clutches are *sure* for all purposes. We study each application on its own conditions, and build a clutch that is just right for the job.

When you are tired of experimenting, let us have a chance.

Do Your Castings Cost Too Much?

A rearrangement of your patterns might cut their cost 25%; a different method of molding them might double your production at no increase in molding cost. We can advise you and we have expert metal and wood pattern-makers who are able to make any changes that may commend themselves to you.

If you need some new Patterns

send us a sample, blueprint or sketch, and ask for our advice. It won't cost you anything. If our advice is good and commends itself to you, it is only fair to assume that our work will be equally satisfactory, and we need the work as badly as you need the patterns.
We are in a position to do turning, boring, drilling or other semi-finishing operations on castings supplied by us.

ASK US

3 Minutes to Drill 20 Holes

That makes a total of 20 Cylinder Blocks (400 holes) drilled every hour. We really should say "Multi-Drilled," for that is why this output is possible.

A Motor Driven NATCO is doing it in the plant of the Harroun Motor Car Company, Detroit—and thereby making the day 20 times as productive; the entire 20 holes are drilled at the same time. One hole at a time method would not only take 20 times as long, but would require 20 men and 20 machines.

As many as 72 holes, of various sizes, can be drilled, tapped, reamed, spotfaced or counterbored at the same time. The NATCO patented feature—Independent Change of Speed for each Drill—provides the approximate correct speed for each size tool.

Shall we give you production estimates on your work? Simply send us blueprints.

We also design and build jigs and fixtures for use in connection with NATCO Multi-Drillers.

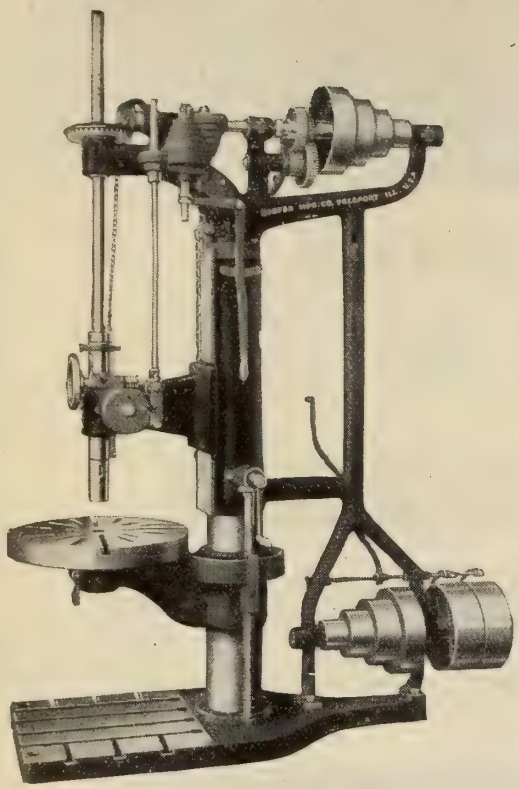
The Driller for Exact Work



HOEFER

Enable Your Workmen to Eliminate Spoilage

The Hoefer Driller is pre-eminently the one to be found in the best plants. "It's almost as good as a Hoefer," so often heard in the machine and tool trade, indicates the position held by Hoefer Drillers.

Exact drilling, to the last thousandth of an inch, pays by eliminating spoiled material. Hoefer Drillers pay for themselves and increase the workman's pride in his work.

Twenty-five Years on Market

Twenty-five years making drillers has given Hoefer the "Know-how." The Hoefer Drillers are used by many of America's leading manufacturers. Equip your factory the Hoefer way. Take any kind of a drilling problem you have to the Hoefer Manufacturing Company, and the Company's experts can tell you how it was solved by other men, some of whom you may know.

Investigate now. Write to-day for catalog. The Hoefer engineers are at your service.

W. S. ROCKWELL CO. INDUSTRIAL FURNACES ESTABLISHED 1888 50 CHURCH ST. NEW YORK

Would you like to have us prove that

Peerless HIGH SPEED

Machines do 50 to 100% more work

The Peerless has established a new standard of production in so many plants that we are ready to ship one at our expense and risk, if you agree to give it a thorough test. A trial like this often results in our selling from 1 to 10 machines.

The Balance Lift of the Peerless

automatically raises the blade for the return stroke. This greatly prolongs the life of the blades, economizes power, and increases production. There are more good features which we shall be glad to acquaint you with.

The Peerless assures you the peak of production at very lowest cost. Write for full details.

PEERLESS MACHINE CO.

1607 RACINE STREET RACINE, WISCONSIN

BECKER BELT-DRIVEN MILLERS

for

GREATER PRODUCTION because they work continuously—every hour of operation is a production hour—

ECONOMY OF OPERATION because they are power savers; the internal belt drive forms an elastic drive to the spindle that prolongs the life of the cutter by eliminating chatter and vibration.

ACCURACY because the machines have exceptionally fine feeds and are equipped with micrometer dials and stop gauges. The Patent Becker Gibbing keeps the work permanently aligned with the spindle.

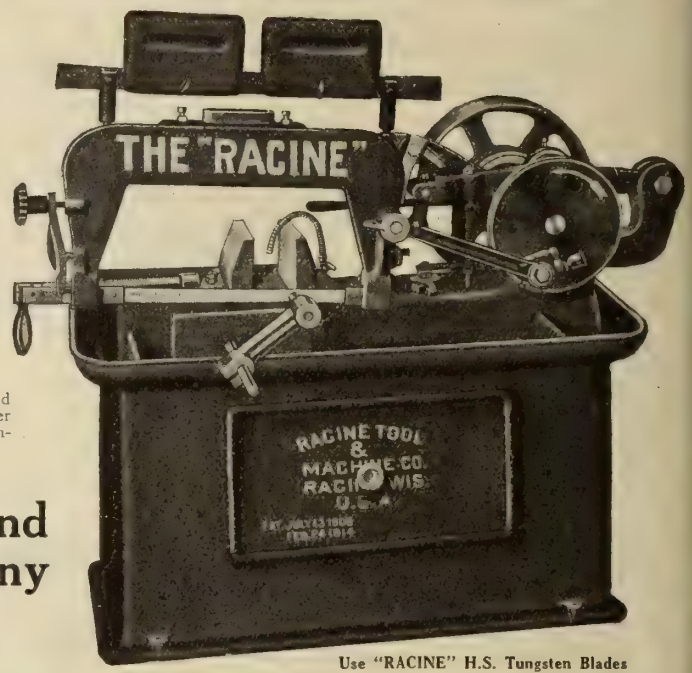
Reduce Your Metal Cutting Costs with

THE "RACINE"

Speediest of All Metal Cutters

DO you know that the "RACINE" High Speed Cutting Machine has a patented feature that lifts it above any other metal cutter made? This is the patented Automatic Lifting Device, which automatically lifts the blade on the return stroke, preventing all dragging and strain on the non-cutting stroke. **The result is speedier cutting with less power and a big saving in blades.**

Instal the "RACINE" to Offset High Cost of Production!

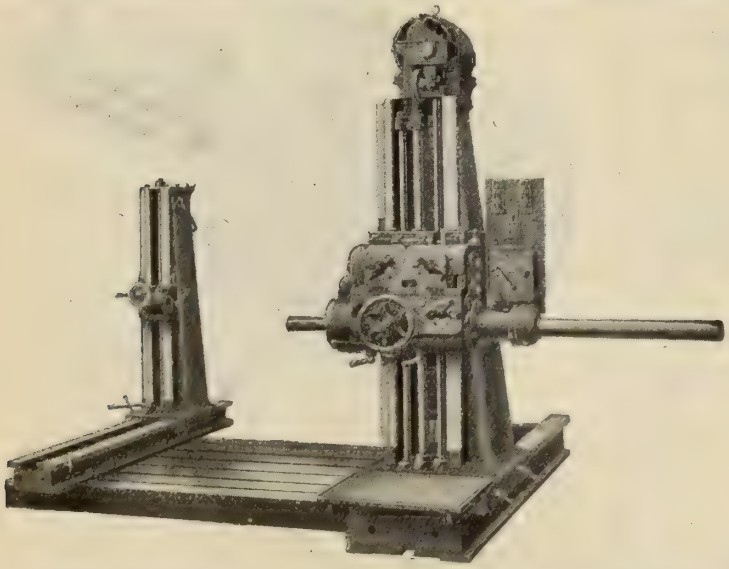


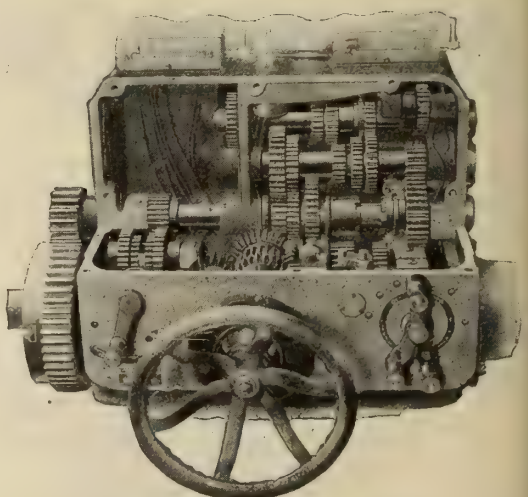
THE "RACINE" machine and "RACINE" H.S. Tungsten Power Blades make an efficient and economical combination—use both.

Standard the World Over

Racine Tool and Machine Company
Melbourne Ave.
RACINE, WIS., U.S.A.

Use "RACINE" H.S. Tungsten Blades





View of saddle with cover removed

Saddle of Improved Box Type Construction

In the Landis Boring Machine the saddle consists of two heavy castings, the body and cover, machined to a right-angle fit and tightly joined.

A train of feed change gears, with the cover form one unit, and the speed gears and spindle, with the body, complete the other.

All operating levers are so placed that they may be reached by the operator from one position. All hand feeding is manipulated through one hand wheel. The feeding of the spindle in either direction is caused by a differential speed between the feed nut and the spindle.

These improvements are but a few of the Landis features which make this boring machine so efficient.

LANDIS TOOL COMPANY

WAYNESBORO, PA.
New York City—50 Church Street

Smalley General
No. 1 Flange Thread Miller

Sturdy
Powerful
Accurate

Mills Flange Threads With Fewer Rejects Than Any Other Miller.

SHORTER hours and higher wages are demanded by workmen. This means increased production costs. How are you meeting the situation? By putting up the price of your products? There is another and more satisfactory method! It is found in giving your workmen improved tools to operate with—tools that are capable of turning out more work per hour.

The Smalley-General No. 1 Flange Thread Miller is sturdy, accurate and fast.

It is so simple in design that an ordinary mechanic can turn out more work in eight hours than is possible by any other method of thread cutting in ten hours.

It is the most efficient tool of its kind and because of its several exclusive features will mill flange threads with fewer rejects and at a lower cost.

The same outstanding principle which applies to all **Smalley-General Thread Millers** applies to the **No. 1 Flange Thread Miller.** While the work held in the chuck makes one revolution, the milling head is moved back on the ways, a distance amounting to the pitch of the thread to be milled, and when a multiple tooth hob is used, the thread is complete at ONE revolution of the work.

There are many other points in the construction of this tool you would be interested to know about. **May we send you a complete description of the machine?**

No. 12—Plain Milling Machine—Use Code Abrade

No.12 PLAIN MILLING MACHINE
ALL LIGHT MANUFACTURING

This machine is built especially strong and substantial for a tool of its capacity, and has many valuable features worthy of special mention. The slide is fitted with a quick pitch screw, giving one inch per turn. This combines the rigidity of a rack feed with the steadiness of the screw feed. The table has an oil pan all around it, with finished edges—automatic feed, trip and reverse—adjustable nut on the feed screw to take wear—the Feed Screw is hardened.

Adjustments ..... 18 x 6 x 15 in.

Announcing—

WILLIAMS' "Vulcan" Forged-Cutter Tool Holders give unequalled service to those who prefer the solid, forged-type of cutting tool. Each Holder, by the mere insertion of small High Speed Forged-Cutters is adapted to the heaviest service on Lathe, Planer, etc.

The economy and convenience of this line, when installed as standard shop equipment, is at once apparent, as all blacksmith work, to say nothing of the very considerable investment necessitated by heavy, solid forged-tools of costly High Speed Steel, is eliminated.

Absolutely simple in construction, yet possessing all the advantages of the solid tool without its expense.

Cutters, drop-forged from the finest grade of High Speed Steel, in stock in a great variety of sizes and types, finished and hardened ready for use. Ask for descriptive booklet.

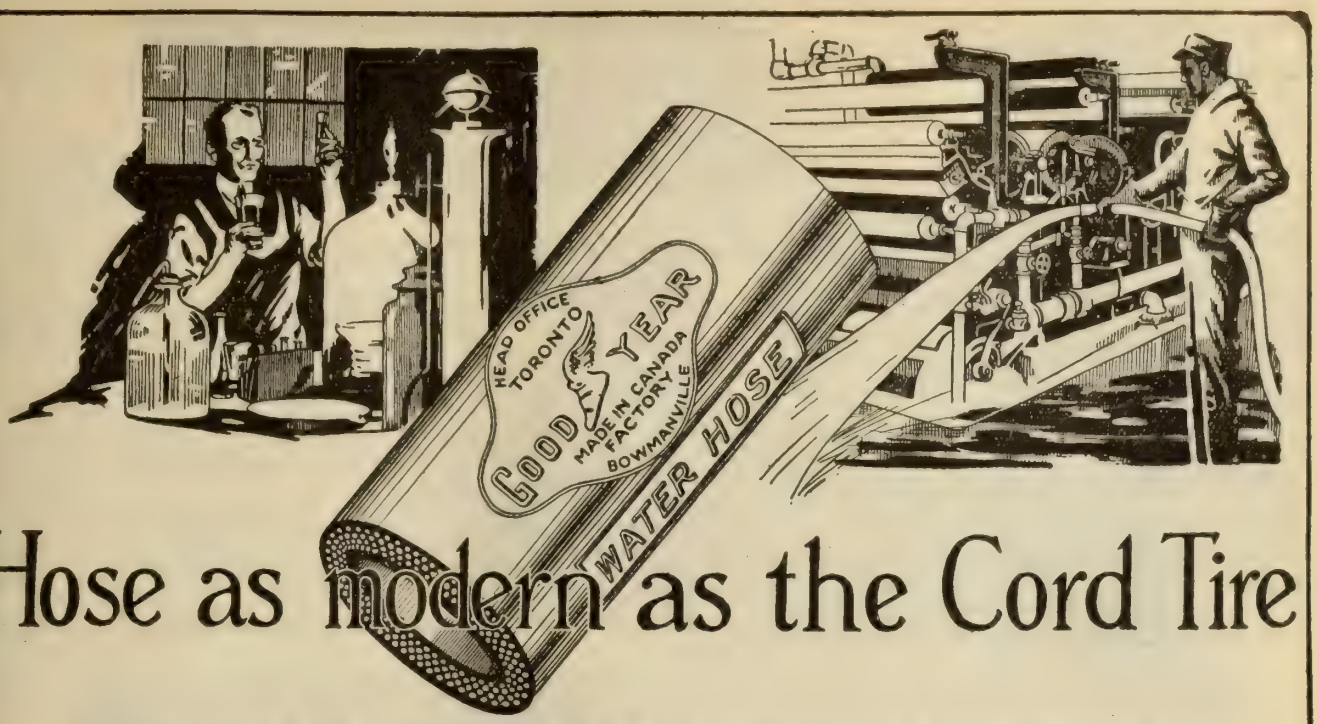
Williams' "Vulcan" Forged-Cutter Tool Holders



Hose as modern as the Cord Tire

Go back to the days before Goodyear undertook to produce better hose, and you will find that rubber hose was built in much the same way that most hose is to-day.

An old-fashioned product. Good enough for those times, perhaps, but inadequate to meet modern standards of efficiency.

Goodyear opened a new era in the industry. Goodyear disregarded tradition. Goodyear's engineers started from the ground up to build hose of modern efficiency to meet modern needs.

The inevitable result of such methods was the development of better materials and improved hose construction.

Old ideas and old methods were forgotten. Goodyear Hose was built as if hose had never been built before. Modern industry's hose needs was the standard built to.

Is it any wonder, then, that the quality of Goodyear Industrial Hose dominates as does the quality of Goodyear Cord Tires?

Is it any wonder that Goodyear Hose gives longer, more satisfactory service and costs less in the end?

Goodyear builds a particular hose for every industrial purpose—water, steam, pneumatic tool, air drill, railway, fire, suction, and so on.

Let a man trained by Goodyear study your hose problem. Phone, wire or write the nearest branch.

BRISTOOL

Bristol 12-inch Rotary Precision Surface Grinder

Built for rapid production on grinding work.

It handles work either singly or in multiples within the capacity of the chuck and not thicker than 6-in., and grinds within quarter thousand in. of manufacturing accuracy.

And it is built to last.

It is provided with exceptionally long bearings throughout, especially in the back column. This prevents the wear, which is very slight, from affecting the accuracy of the grinder. The Back Column is made to swivel four degrees, which allows concave or convex grinding.

Bristol Rotary Surface Grinders are made in several types and sizes and are regularly equipped with 8-in., 12-in., and 16-in. magnetic chucks, either belt or motor driven and for dry or wet grinding.

Our Bulletin describes the many good points fully. Send us your name and address and we'll gladly mail you one.

Notes On Grinding

NORTON COMPANY WORCESTER, MASS.

No. 74A

Monel Metal

Monel metal is an alloy consisting of approximately 67% nickel, 28% copper, and 5% other metals. It can hardly be distinguished from pure nickel in color and in tensile properties it closely resembles steel, as can be seen from the following table:

	Monel Metal Castings	Steel Castings
Melting Point.....	2,480° F	2,500° F
Hardness (Scleroscope) ...	20—23	22—25
Tensile Strength .....72,000 lbs. per sq. in.		60,000 to 80,000 lbs. per sq. in.

Monel metal is tough and ductile and can be machined, forged, soldered, brazed, and welded by the electric or oxyacetylene method.

It lends itself admirably to casting and many very intricate patterns have been successfully cast. In rod form, its tensile strength is also high and it may be worked with equal facility either hot or cold.

In addition to its resistance to corrosive conditions, monel metal also resists oxidation due to its high nickel content, since nickel possesses in a high degree the property of withstanding the oxidizing influences of hot gases. Monel metal is used extensively for turbine blades and its selection is largely due to its great strength at high temperature, its resistance to the erosive action of steam and its resistance to corrosion. It is also used extensively for pump liners, rods, and valves, because of its extreme toughness and its resistance to abrasion and corrosion.

Other uses of Monel metal are in dyeing machiney, where the metal must withstand strong acid or alkaline solutions; pickling-tank fittings; golf club heads; needle valves in carburetors; tubes, wire cloth, and wire rope.

Monel metal machines with a long tough chip, in this respect resembling copper, but requiring somewhat more power to cut. For this reason the finishing of monel metal by means of grinding wheels or artificial abrasives is to be recommended. For the cylindrical grinding of this material on precision grinding machines, the usual grinding lubricants should always be used. Successful results are usually obtained with an Alundum vitrified wheel, grain 46, grades L or M or 24 combination, grades L or M.

For snagging castings composed of monel metal on floor stand or swing frame grinding machines, Alundum vitrified wheels, grain 16 or 20, grade Q, or grain 16, grade R, usually give satisfaction.

For cleaning heavy monel metal castings with a flexible shaft or portable electric grinding machine, our small 6" or 8" diameter wheels from ¾" to 1½" thick, grain 24. grades R or S Alundum vitrified have been used with success.

There is a certain demand for thin rubber bonded grinding wheels for use on abrasive cutting-off machines, for removing gates and risers from castings, and also for cutting rods, tubes, and wire. For these, we recommend 16 or 20 grit Alundum rubber wheels from 10" to 12" diameter and from 3-32" to ⅛" thick.

Making *Coke* for the *Blast Furnace*

An Article Which Describes the Making of Coke in the By-Product Coke Oven

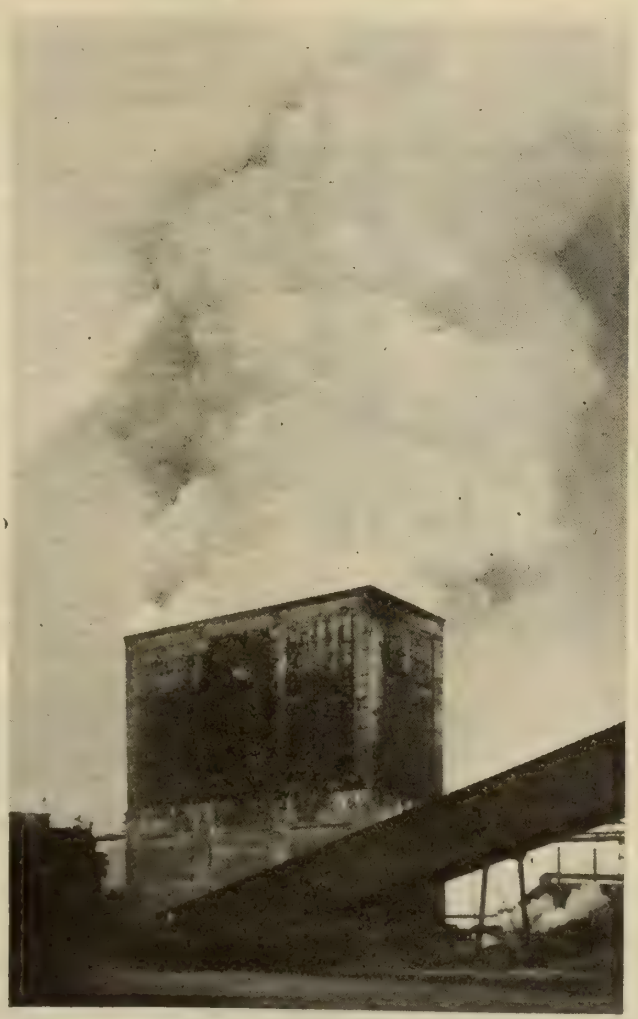
By W. F. SUTHERLAND

The Ovens Are Installed at the Hamilton Plant of The Steel Company of Canada

PRIMITIVE man probably first made iron in an ordinary fire, then improved upon his method by bettering the draft. Later on, the use of the bellows was adopted. The intentional making of cast iron and its conversion into wrought iron and steel followed at a later date and in the fifteenth century ornamental iron castings were made.

Charcoal was the fuel used and the appetite of even the crude furnaces then employed was such as to bring about the first agitation for fuel conservation. Queen Elizabeth forbade the cutting of wood in certain parts of the country and later, furnaces were prohibited in some counties.

This increasing scarcity of wood was probably the reason for the attempts which were made to replace charcoal by mineral fuel. In 1611 Simon Sturtevant patented the use of coal for iron smelting, but it was not until 1735 that Abraham Darby showed how to make cast iron with coke in the high furnace, which by this time had become a veritable blast furnace, although primitive. From this time on charcoal as a metallurgical fuel fell into disuse and is to-day only used where exceptionally pure iron is required.



On a quiet day when the clouds hang low the quenching station is well worth observing. The steam given off in quenching rises to mingle with the clouds above.

The art of making coke, up to comparatively recent years, made little advance and the bee-hive oven in general use to-day resembles the original type very closely. Having the advantage of cheapness in construction and giving good coke, it suffers from the disadvantage of wasting all the gas and other valuable by-products obtained from the original coal. It is in its essentials, nothing but a brick-lined chamber in which the gas, driven off from the coal. It is, in its essen- the coking operation.

The modern by-product oven, a comparatively recent development, on the other hand conserves the gas, tar and nitrogen content of the coal and where combined with blast furnace and steel plant renders a cheap gaseous fuel available for open hearths and other equipment. It also enables the metallurgist to control the quality and physical properties of the coke to a nicety.

The Steel Company of Canada have been operating their new coke ovens at the Hamilton plant for about a year and the following article is descriptive of the plant itself and of its operating characteristics.

Coke used for blast furnace work should be hard,

GENERAL VIEW OF THE HAMILTON WORKS, THE STEEL COMPANY OF CANADA, THROUGH THE DIFFERENT DEPARTMENTS OF WHICH THE BY-PRODUCT COKE IS USED.

strong, porous and regular in composition. It is very light as compared with the coal from which it is made and it is estimated that 50 per cent. of its volume is air space. The amount of sulphur is of importance, for if much is present it enters the iron or necessitates higher temperatures in the blast furnace for its elimination in the slag. Generally speaking, coke with less than one per cent. sulphur is satisfactory.

Since the physical properties and chemical composition of the coke are of such moment, the grade of coal used is of importance. In the present case two kinds are employed, one running about 34 per cent. volatile and the other about 17 per cent. Both run about 8 to 9 per cent. ash content and contain .8 per cent. or less of sulphur.

The coal is unloaded into a receiving pit capable of handling two cars and from this is lifted by an apron conveyor onto a 30-in. belt conveyor. This conveyor, driven by a 50 h.p. motor, carries the coal to the top of the coal-handling plant where it is delivered into the crusher. The crushing is done by a Bradford breaker and on being crushed the coal is screened, the slate, etc., being separated and delivered to a reject bin.

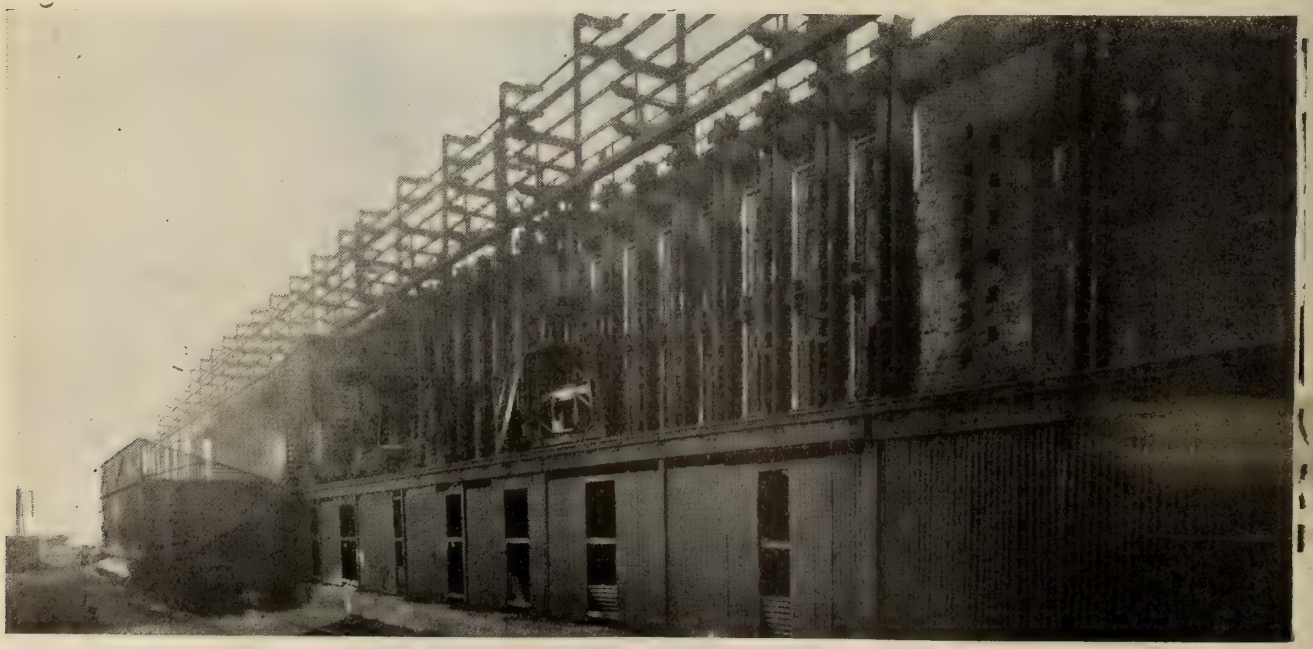
From the crusher the coal is delivered into either one of two mixing bins depending on its volatile content and from these it is drawn out onto the mixing table one floor below. This table consists of two short apron conveyors in line, with their upper surfaces travelling towards each other. The depth of coal on each conveyor is regulated by means of independently adjustable gates. By means of the gates any desired percentage of high and low volatile coals is obtained; at the present time the mixture runs about 85 per cent. high and 15 per cent. low volatile.

From the mixing table the coal now composed of the two grades goes to a hammer mill below, where it is pulverized fine enough for eighty per cent. to pass a ⅛-in. mesh screen. From the pulverizer the coal is conveyed by belt conveyors to a transfer tower and then at right angles by another conveyor to a coal storage bunker holding 1,400 tons. The hammer mill was supplied by the Williams Patent Pulverizer & Crusher Co., and is driven by a 300 h.p. three-phase Canadian Westinghouse induction motor of the wound rotor type. The mixing table is driven by a 10 h.p. squirrel cage induction motor, also of Canadian Westinghouse make. The coal-handling plant, together with the conveying system, was installed complete by Heyl & Patterson, Pittsburgh, Pa.

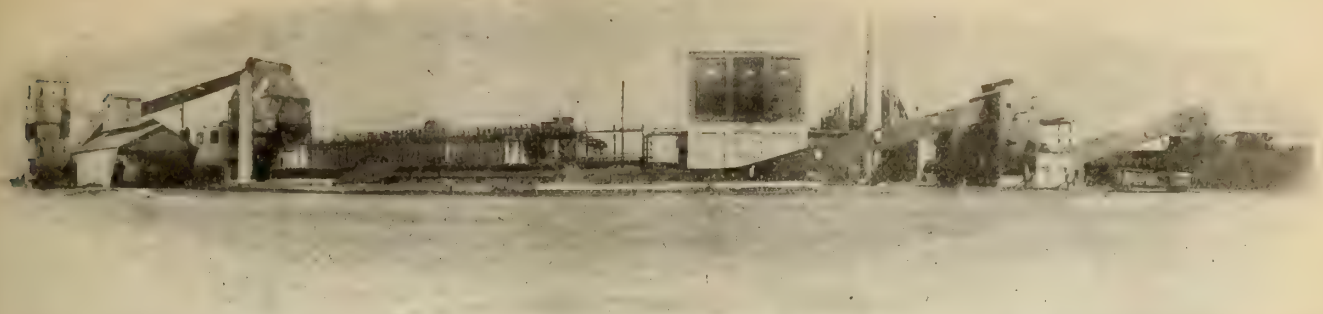
Coke Ovens

The Wilputte by-product coke ovens are arranged in two batteries placed end to end. Each battery consists of 40 separate ovens. Between each oven 28 flues are built into the side walls by means of which the ovens are heated by conduction through the brickwork. Below the ovens and flues proper, regenerative chambers are built in. These are filled with checkerwork and function similarly to those used with the open hearth. A cross-flue connects the tops of the vertical flues with whichever portion of the regenerator is on heat. The air necessary for the combustion of the gas employed passes through that side of the regenerator which is on blast and passes upwards into the twenty-eight vertical flues. At the bottom of these it meets the incoming gas and combustion takes place.

A balanced draft system is employed, that is forced draft delivers the air to the regenerators and induced draft removes the products of combustion. The fans for the air supply are of Canadian Sirocco type and are steam-driven. Three are provided, two in constant use and one



THE DISCHARGE SIDE OF THE COKE OVENS, SHOWING QUENCHING CAR.



A VIEW OF THE COKE OVENS, SHOWING THE COAL BREAKERS TO THE LEFT AND THE LOADING ELEVATORS TO THE RIGHT, OVER WHICH THE COKE IS PASSED IN BEING LOADED FOR SHIPMENT.

spare. The volume of air supplied is controlled from the chart room immediately above.

The induced draft apparatus is housed in a separate building and here three Canadian Sirocco fans are also provided, one of them spare as before. The products of combustion escape through two radial brick chimneys six feet by 75 ft. in height. These chimneys were installed by the M. W. Kellog Co., New York. The exhaust fans are steam-driven and the engines have 8 in. cylinders by 8 in. stroke.

Ordinarily it has been customary on installations of this type to dispense with induced draft fans and to use 200 ft. chimneys for the securing of the necessary draft. It was thought, however, that better regulation and control could be secured with the equipment installed, and operation has confirmed this opinion.

The gas necessary for the maintaining of the proper temperature in the ovens is supplied by two sixteen-inch mains which are carried along the outside walls a few feet above ground level. From these gas mains risers are led off and into the flues. Each riser is equipped with a valve actuated by a rod running the full length of each battery and operated by a motor-driven controlling mechanism.

The air supply is also controlled by reversing valves, motor-operated, and at each half-hour period the flow of air through the regenerators is reversed.

Chart Room

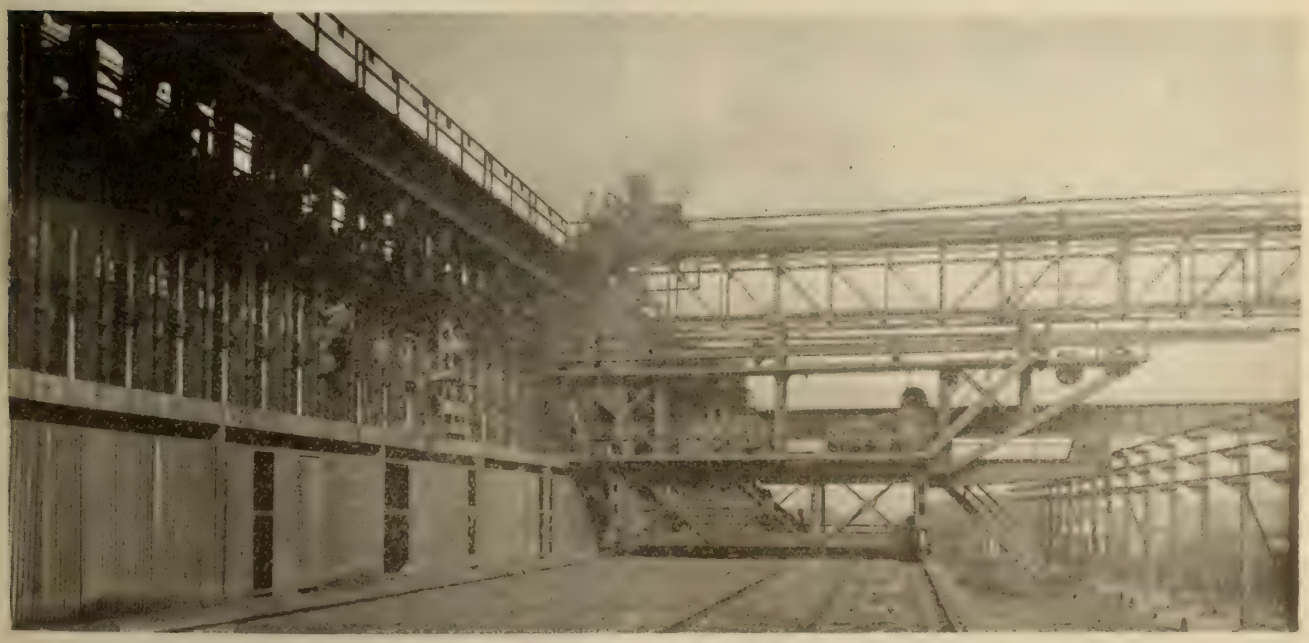
Between the two batteries and over the fan room, a chart room is located. All recording instruments and controls are brought together in this room which provides a central point from which all operations can be directed.

The gas consumed in the heating of the ovens is here measured by two Venturi meters and the pressure on the gas main, the forced draft and induced draft pressures are measured by three Bacharach pressure recording gauges for each battery.

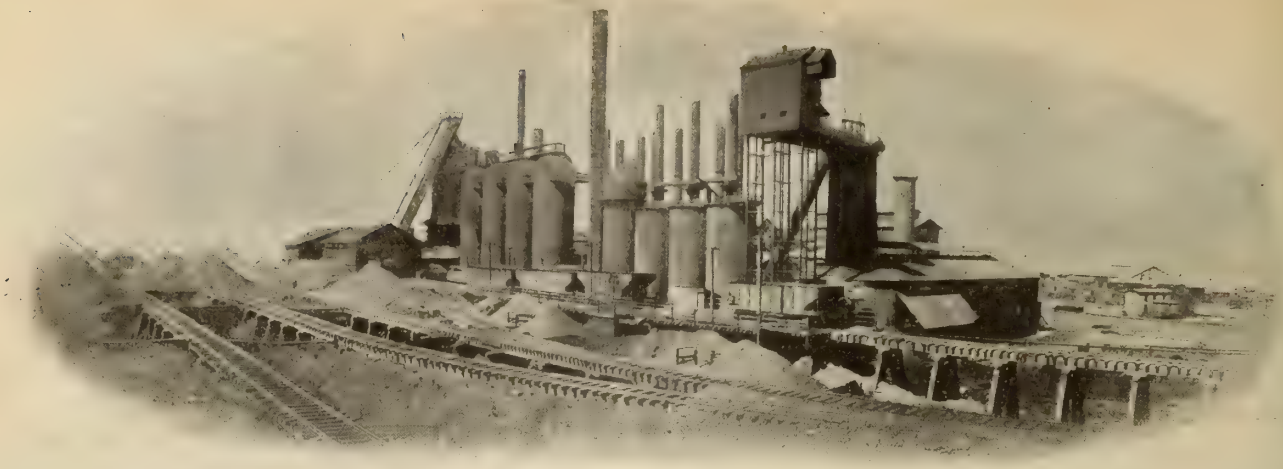
Charging

The ovens are charged from above through four openings to each oven. A charging lorry with four bins travels the full length of the two batteries and receives its supply from the 1,400-ton bunker which is located overhead. Each hopper of the charging lorry holds sufficient coal for the charging of its portion of each oven. Between the ovens and immediately over each of the twenty-eight flues in the side-walls inspection holes are provided by means of which the condition of the brickwork and the combustion going on below can be observed.

When the charge in each oven is converted into coke it is removed by a pusher, almost human in its functions. The pusher travels the full length of the two batteries and is provided with three rams, one of which lifts the oven door off and draws it back out of the way, rocking it about a horizontal axis first to break the clay luting provided for gas tightness. The second ram, when this is accomplished, is advanced and pushes the coke through the door at the other end of the oven. The third ram is used after the doors have been placed back in position



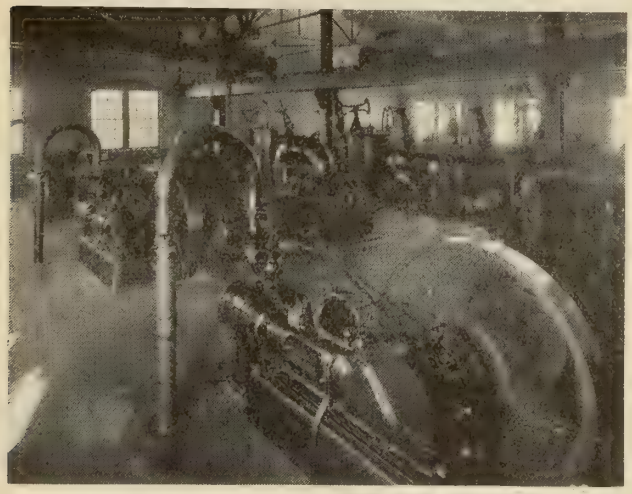
THE COKE PUSHER WHICH REMOVES THE OVEN DOORS, PUSHES THE COKE OUT ON THE OTHER SIDE INTO THE QUENCHING CAR AND THEN LEVELS DOWN THE FRESH CHARGE.



THE BLAST FURNACES AND ORE PILES. THE MAJOR PORTION OF THE BY-PRODUCT COKE, PRODUCED IN THE COKE OVENS, IS USED IN THESE BLAST FURNACES.

and when the fresh charge is placed. It is advanced and withdrawn several times through a small opening in the door and serves to level off the top of the charge.

The main pusher ram is driven by rack and pinion



THE EXHAUSTERS SHOWN HERE BRING THE GAS OVER FROM THE OVENS INTO THE BY-PRODUCT PLANT.

through two intermediate gear trains from a 75 h.p. motor of railway type. A magnetic brake is provided. The levelling ram is driven by a similar motor through a drum and cables. The door extractor is advanced from the cab and its further operation controlled by the door man on the platform. The coke pusher was supplied by Wellman-Seaver-Morgan, Cleveland.

The doors on the discharge side of the ovens are removed by a travelling extractor which is also provided with a coke chute to guide the red hot coke over the platform and into the quenching car below. The quenching car on receiving its load travels to a quenching station, shown in our first illustration, where the coke is wet down and later discharged onto an incline from which it makes its way by conveyor to the coke-handling plant.

The temperature at which the ovens are run has an important effect on the life of the brickwork; at this plant the side-wall temperature carried is 2,200° Fah. Silica brick are used of Harbison-Walker manufacture.

By-Product Plant

In the making of coke a number of valuable by-products are given off, gas which has a high calorific value, coal tar which finds use in the chemical industries and as a fuel, and ammonia compounds. All of these have considerable commercial value and when used in the steel mill or sold, materially lower the cost of the coke. A by-product plant is installed which purifies the gas and recovers the tar, ammonia content, and naphthalene carried over from the ovens.

Each oven is provided with an ascension pipe through which all volatile matters driven off during coking pass. Each pipe is equipped with a cap opening to atmosphere and a mushroom valve, and terminates in a common header. When charging, the gas driven off is allowed to escape until the operation is complete when the mushroom valve is opened and the gases allowed to pass into the header. The header running the full length of the two batteries has tar constantly circulating through it to catch any particles of free carbon carried over.

From the header the gases pass over the pusher runway to the by-products plant and enter the condensers or primary coolers. These primary coolers, shown in one of our illustrations, are three in number, one of them spare. Each of them contain about 900 tubes through which water is constantly circulated on the counter-flow principle. The gases passing over the tubes have their temperature materially lowered and here most of the tar is thrown down, together with ammonia liquor and some naphthalene.

From the primary coolers the gas passes through the gas exhauster plant which provides the suction necessary

ONE OF THE GAS MAINS ON THE COKE OVENS SHOWING THE RISERS AND VALVE CONTROL.

THE OPEN HEARTH STEEL FURNACES, WHICH ARE HEATED BY THE GAS AND TAR PRODUCED BY THESE MODERN OVENS. GAS AND TAR ARE TWO OF THE VALUABLE BY-PRODUCTS.

to draw it over from the ovens. Three units are again provided here, two of them constantly in use and the third one as a spare. The blowers are built by the Connersville Blower Co., Connersville, Ind., and have a displacement of 51.7 cu. ft. per revolution. They are steam-driven, and Fleming engines are employed, made by the Harrisburg Foundry and Machine Works, Harrisburg, Pa. These units are controlled by electrical pressure regulators made by the Rateau Battu Smoot Co., New York. The speed is automatically varied according to amount of gas coming from the ovens and by this means a constant suction is maintained.

From the exhaustor the gas passes to the tar extractors which eliminate any tar fog which may remain. These extractors are three in number, one of them spare, and consist of vertical tanks which contain sheet steel bells perforated with 1-16 in. holes. The holes in successive cones are staggered and any particles of suspended tar are thus eliminated.

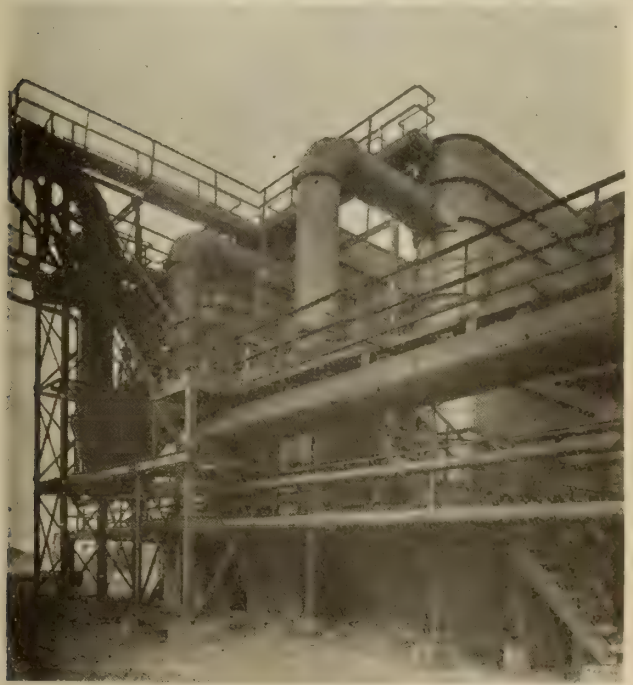
The gas is now free from tar but still contains considerable ammonia vapor. This is eliminated by the saturators through which the gas next passes. Three in number as before, these consist of large cast iron tanks lead-lined in which a 6 to 8 per cent. solution of sulphuric acid is maintained. The gas passing through this acid liquor gives up its ammonia content which unites with the sulphuric acid to form ammonium sulphate. As this

COKE AFTER BEING QUENCHED.

salt accumulates the solution becomes saturated and crystals of ammonium sulphate are thrown down. To effect their removal the principle of the air lift pump is adopted. A jet of air is blown into the bottom of a vertical discharge pipe and carries with it the crystals of sulphate together with some of the acid liquor. Flowing out of the saturator at the top, the mixture passes into lead lined settling trays where the ammonium sulphate falls to the bottom. It is then thrown into steam-driven, centrifugal separators where any remaining acid liquor is thrown off. The liquor is here recovered, and that from the starting point from which countless coal tar dyes monium sulphate is taken to the salt room where it is bagged and shipped to outside consumers.

Quite a romance might well be written about the by-product end of the coke industry. The coal tar is the starting point from which countless coal tar dyes and chemicals are made, and the nitrogen content of the coal is of great value to agriculture and other industries. Nitrogen compounds are essential to vegetable growth, and when these have been exhausted in the soil through intensive cultivation, artificial fertilizers are necessary.

Sulphuric acid has to be added to replace that used in the formation of the ammonium sulphate and it is found that about one pound of acid is required for each pound of sulphate made.



THE PRIMARY COOLERS IN WHICH THE GAS IS COOLED AND IS FREED OF THE GREATER PART OF THE TAR AND AMMONIA LIQUOR.

A GENERAL VIEW OF THE BY-PRODUCT COKE OVENS.

Ammonium sulphate or sulphate of ammonia is one of the most valuable of nitrogenous fertilizers owing to its chemical and other characteristics, and that made at this plant goes to practically every corner of the world. Japan is one of the largest consumers; Java, the Barbadoes and other countries use vast quantities of this fertilizer and it finds considerable use in the cotton-growing countries of the tropics.

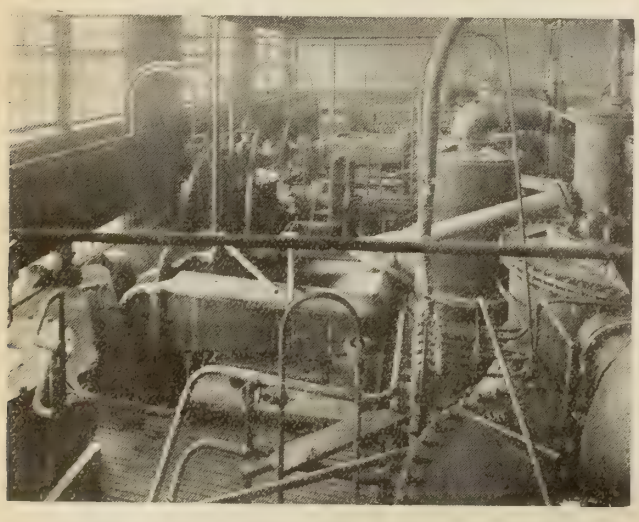
The product exported and otherwise sold by the Steel Company of Canada is aptly named "Gromore," owing to its important usefulness as a fertilizer, and has a whitish or grayish color. Its importance as a plant food is due to the fact that it contains 25 per cent. ammonia and more than 20.5 per cent. nitrogen. This makes it the richest of nitrogenous materials.

Ammonium sulphate can be used alone as a fertilizer, but more often reaches the farmer in the form of mixed fertilizers. It can be used with acid phosphate, potash salts, cotton seed meal, tankage and fish scraps. It is not subject to chemical action when thus incorporated into a mixed fertilizer and its freedom from free acid and moisture is also of advantage.

Disposal of Gas

The gas, now free of tar and ammonia, finally passes through a washing tower where it meets a spray of water and is made ready for use. The water passing through this tower removes the naphthalene present in the gas and this is caught in settling basins for disposal.

From the washer the gas goes to the gas holder and from this it is distributed to the open-hearths, the boiler room and to the coke ovens. That portion which goes to the open-hearth furnaces passes through an exhauster which raises its pressure to 5½ lb. The "Root" exhauster is driven by an R. 20x20 in. Ridgeway engine and has a capacity of 8,000,000 cu. ft. per 24 hours.



THE SATURATORS IN WHICH THE AMMONIA IN THE GAS IS CONVERTED INTO AMMONIUM SULPHATE.

Tar Storage and Ammonia Still

The tar and ammonia liquor begin to separate out at the header on the coke ovens and each header, and connecting pipe contribute some to the total yield. By far the largest portion is recovered in the primary coolers and the remaining small fraction of the yield is obtained

SALT ROOM IN WHICH THE AMMONIA SULPHATE IS STORED.

by the tar extractors. All the tar and ammonia liquor collected from the above sources is pumped into a separating tank. The tar, having a specific gravity of 1.2, settles to the bottom of the tank and is pumped into a tar storage tank. The ammonia liquor flows off and into an ammonia tank. About 25 per cent. of the total ammonia yield is obtained from the liquor, and since this quantity is well worth recovering the liquor is treated.

The weak liquor is pumped from the tank into an ammonia still where it is subjected to heat from low pressure steam. The heat serves to drive off the free ammonia and the addition of lime frees the fixed ammonia.

The mixture of steam and ammonia vapor passes into a dephlegmator or condenser which cools the mixture down below 212°, to 190° to be exact. At this temperature the steam is condensed while the ammonia remains as a gas and passes on into the main gas line before it enters the saturators. Here it is converted into ammonium sulphate together with the 75 per cent. which comes over direct in the main gas line.

The operation of the by-product plant necessitates the handling of various kinds of liquids and a pump room is provided for the various pumps. Tar pumps of both centrifugal and duplex plunger type are provided for flushing the tar through the mains and headers. The centrifugal pump is of the Goulds single-stage type and has a capacity of 660 U.S. gallons against a 90 ft. head. It is driven

THE COAL STOCK PILES, SHOWING THE ENORMOUS TONNAGE OF COAL ALWAYS ON HAND TO SUPPLY THE COKE OVEN REQUIREMENTS.

by a Canadian Westinghouse 30 h.p. induction motor.

Two air compressors are also installed, made by the Chicago Pneumatic Tool Co.

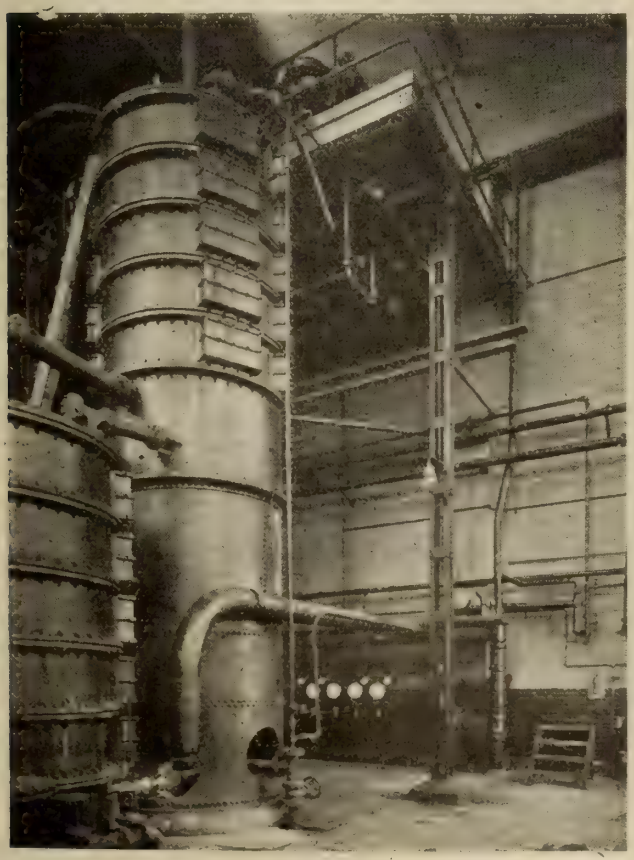
Operating Characteristics

Approximately 13 tons of coal are charged into each oven at a time. The coking time is 17½ hours and 108 ovens are charged per day, producing 900 tons of coke. Of this quantity the greater portion is required for the Steel Company's own blast furnaces, the remainder being disposed of to outside firms.

Each ton of coal as fired produces 11,000 cu. ft. of gas, 11 U.S. gallons of tar and 27 lb. ammonium sulphate. Forty per cent. of the gas is used in heating the ovens and the remainder is available for other plant purposes. The tar, together with most of the gas, is used in firing the open-hearth furnaces of which there are eleven. From each ton of coal three-quarters of a ton of coke are obtained.

Steam Generation

A considerable quantity of steam is used for the ammonia still and for the various engine-driven fans and exhausters. For the generation of this steam a boiler plant of 750 boiler horsepower has been erected.



THE AMMONIA STILL IN WHICH THE AMMONIA LIQUOR GIVES UP ITS AMMONIA CONTENT.

Three Erie City double-drum water tube boilers are installed of 250 h.p. each. A steam pressure of 150 lb. is carried and the steam is superheated 100°.

In the making of coke considerable coke breeze or dust is made and this is used as a boiler fuel. The coke-handling plant screens all the coke and the fines are taken by belt conveyor to the boiler house. Here they undergo a further screening, chestnut size and over being eliminated, the remainder dropping into the bunkers in front of the boilers.

Coxe travelling grate stokers made by the Combustion Engineering Corporation, New York, are fitted to the boilers and are specially designed for the burning of the coke dust. This fuel is difficult to burn and in order to keep the ignition arches at the proper temperature it is necessary to burn gas as a supplementary fuel. Four two-inch gas pipes are led into the combustion chamber of the boiler setting above the grate and the gas passing through them is burned by excess air through the grates, no other air supply being needed. About 250,000 cu. ft of gas is burned per 24 hours in addition to the coke screenings.

The boilers are fitted with Diamond soot blowers made by the Diamond Specialty Co., Detroit and Windsor. All valves used in the boiler house are of Crane manufacture. Forced draft is supplied by a Canadian Sirocco fan provided with two engines, one of them spare. Pin and belt type clutches are provided for changing over from one engine to another.

The feedwater is heated in a Cochrane feedwater heater to 210° Fahr. Exhaust steam from the engines at 15 lb. back pressure is used for this purpose.

The feed pumps are in duplicate, two Canadian Fairbanks-Morse 10x6¼ duplex plunger pumps being installed.

The boiler house is some distance from the by-product plant and two six-inch steam lines are provided. These, for part of the distance, are carried overhead on structural frame work.

Construction

The coke ovens and other equipment including the by-product plant and boiler house were designed and installed by the Wilputte Coke Oven Corporation, 469 Fifth Ave., New York City, who also acted as their own general contractors. The silica brick necessary for ovens, etc., was supplied by the Harbison-Walker Co., Joliet, Ind., while the firebrick was furnished by The Evans and Howard Firebrick Co., St. Louis, Mo. All tanks and tankwork were supplied by the Jas. G. Hagey Co., Joliet, Ind. The coal and coke handling plant was furnished by Heyl & Patterson, Pittsburgh, while the Hamilton Bridge Co. furnished the structural steel. The two radial brick chimneys for the coke ovens and a similar but larger chimney for the boiler house were supplied and erected by the M. W. Kellog Co., New York City.

The Styles of Yesterday in Machine Tools

Styles Change in Machinery as Well as in Clothes and the Machine Tools of Yesterday Are Apt to Look Somewhat Queer to Our Modern Eyes

By J. H. MOORE

IN starting an article of this nature the writer is sorely tempted to ask the question: "What length of time should a machine-tool remain in use and yet be termed a machine tool?" In other words, when does it cease to be a machine tool with working possibilities and merely a decoration for the scrap heap?

While this question may seem a simple one on the surface, the writer believes it a very difficult one to answer off-hand, for there are so many points to be taken into consideration. Many an old machine tool has weathered the storm of time, due to receiving careful attention, while other tools, more modern in design, have gone under before their time simply through carelessness on the part of the operator.

For the purpose of this article, we will decide that a tool deserves the name of machine tool so long as it delivers all that is required of it, so on this assumption we will proceed with our story.

In a certain plant in Canada (name not being mentioned, this having nothing to do with our story) there stand two wonderful examples of tool equipment. The first is that of a lathe seventy years old, and the second, a planer whose life has reached the age of seventy-five. Of course, as can be surmised, these tools are slightly? out of date, yet they deliver all that is required of them in an accurate manner. To quote what the owner remarked to the writer: "So long as they remain faithful and serve our purpose why should we dispose of them?"

Not being a salesman of more modern equipment I did not even raise an argument, but proceeded to photograph the tools under discussion.

Fig. 1 illustrates what the camera discovered on its first exposure on Mr. Planer. We see a general view of this machine, just as it appeared after work has been taken off its bed some few hours before. No attempt has been made to tidy it up, but the view has been taken to show it at its worst.

This machine was made by W. H. Gibson & Co., of Rochester, N.Y., some seventy-five years ago. Since then this machine has led a varied life, but even yet is plugging along with wonderful results. At the present time it is engaged chiefly in planing dies, which have a semi-circular contour. A special tool is of course used in the planing head, but the point is this, that the machine turns out the work in splendid shape and in good time. After all, what more is necessary? To get away from the work that the machine is doing and consider the machine itself, let us look at a few differences between this machine and the modern planer.

Note the fancy curved contour at A and compare this with the straight business-like design of modern planers today.

To consider a closer view of this machine, let us look at Fig. 2. Can you imagine the modern machine-tool carrying such fancy decorations on its sides as shown in this picture? Evidently in those days they firmly believed in establishing the nationality of their machines, for the eagle and the stars and stripes tell their own story.

FIG. 2—DECORATIVE TREATMENT ON PLANER.

Last, and perhaps most important of all, we come to Fig. 3. Can you imagine the modern planer equipped with a trip such as shown? The more one looks at it the more one wonders, and yet the basic principle is exactly the same, and although crude in its design, it accomplishes its purpose. The design of neat handles, knobs, etc., was no doubt an unknown quantity in those days. Note the neat? little knob A, which the operator could grab at will on the trip lever. One thing sure he could hardly miss it.

One need only look at the edge of the table on this machine and realize how long it has been in use. From one end to the other are set-screw marks, worn right into the table, where the dog set-screw was tightened. Readers can note this by looking at the photograph.

These few photos give readers some idea of this old-timer, but as one of the workmen said: "If you could only photograph its noise, your fortune would be made." There is no doubt about it as regards noise, for when this machine was started you certainly knew it was in operation, but old age, noise, and all else is superseded by the fact that it delivers the goods.

At Fig. 4 we show a picture of a lathe which has seen seventy-five years of service. This machine was made by I. Anzell, Rochester, N.Y. There are several features on this lathe to which we would like to call your attention. First, look at the saddle A. Readers will no doubt see some difference between this saddle and the type used on the modern tool of the present day?

The thumbscrew B takes over the important task of locking the saddle. This method has also been slightly? improved since those days.

Next let us consider the face-plate C. Note its narrow face and peculiar con-

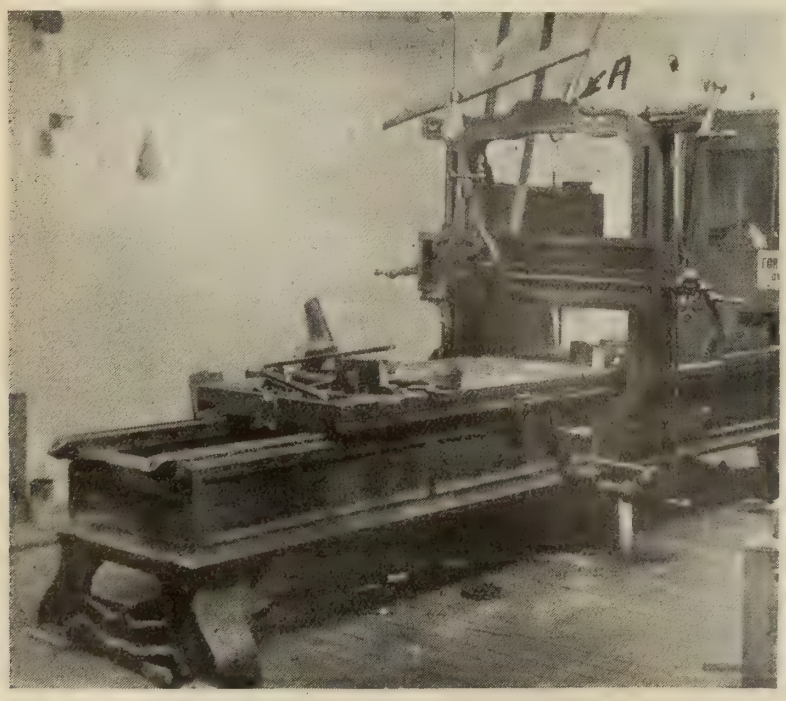


FIG. 1—GENERAL VIEW OF PLANER

struction. Attention is also called to the bearings D. Evidently the importance of wide bearings did not appeal to designers at that time. To hold the train of feed gears in proper mesh the clamp E is called into service and does the work exceedingly well. In addition to these features note the small width of face on all the gears. Finally let us look at the foot F. Here we see the designer's nightmare. Can you imagine a lathe with feet like these at the present time? The back gear is placed in and out of mesh by means of a slotted quadrant, together with an ordinary bolt and wing nut, but enough.

We have, so to speak, picked flaws in this old tool to our heart's content, and yet what is the answer? Joe Mynard, the old chap who operated this lathe for fifty years, claimed it was a good pal to him. Readers may not credit it, but according to the story Joe actually wore a hole in the floor where he stood working this lathe, and they had to patch it up—the floor, not the lathe. Whether this was due to Joe standing on one spot or not, the writer cannot say, but this old tool is still doing duty, turning certain classes of work with good success, relieving the more modern tools of work which would hold production up.

This article has not been an attempt to advocate using tools until they fall apart. Far from it, for the writer's personal opinion is not concerned in this tale. This idea is merely to present before readers an interesting story of how at least two old relics are holding their own.

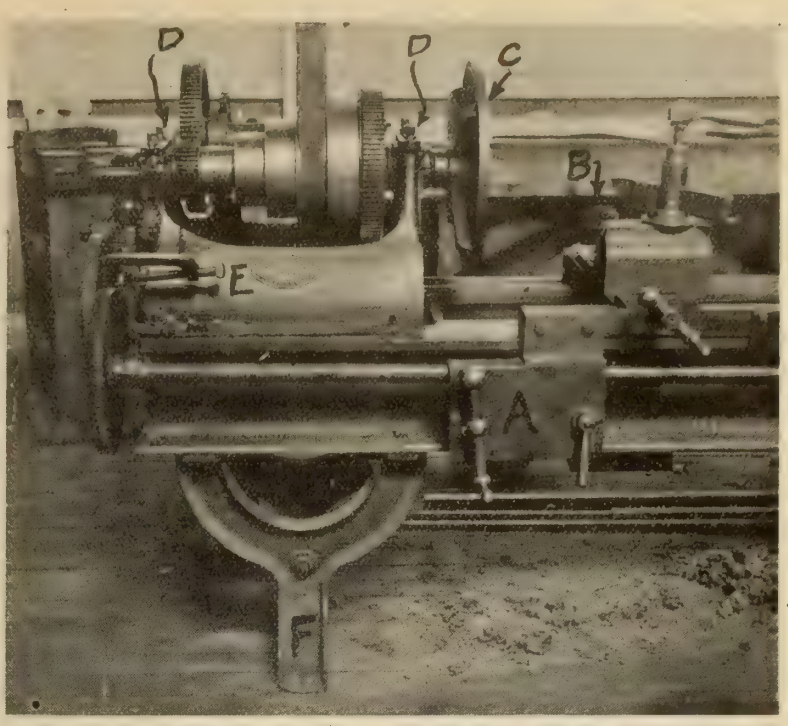

FIG. 4—OLD LATHE.

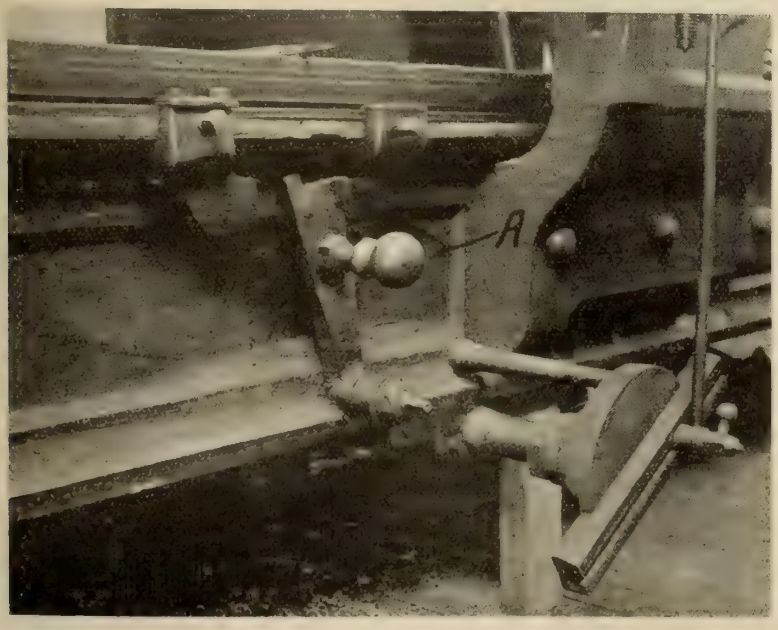

FIG. 3—TRIP MECHANISM.

VANCOUVER CO. INSTALS A "GREAVES-ETCHELLS" ELECTRIC FURNACE

After an extensive investigation of the various types of electric furnaces and a visit to the U. S. Navy Yard at Puget Sound, where a 6-ton "Greaves-Etchells" furnace is in operation, the Vancouver Engineering Works, Ltd., Vancouver, B.C., has given an order to the Electric Furnace Construction Company for a "Greaves-Etchells" furnace.

In a recent paper presented before the American Society of Mechanical Engineers Mr. N. C. Harrison defines pulverized coal as coal that has been reduced to such fine particles that at least 95 per cent. will pass through a 100-mesh sieve having 10,000 openings to the square inch. In other words 95 per cent. must be less than one two-hundredth of an inch cube. He goes on to say that "the average person does not fully realize to what a high degree of fineness it is possible to reduce the coal to-day by pulverization. The finer coal is pulverized the more efficiently it can be burned and the more readily it will be diffused when mixed with the air for combustion and fed into the furnaces. Pulverizing certainly does not change the nature of the coal, but it does change its form to a certain extent in that the coal is changed from a solid into a fuel having liquid properties. As the coal is pulverized it is mixed with air, and when handled in the conveyor it flows like water; when fed to the furnaces it is more or less like a gas, and the furnaces must be designed to burn a gaseous mixture."

In order to facilitate women's work in the repairing shops of the Orleans Railway Company at Paris, where, as in Great Britain, feminine labor is becoming more and more in demand, a very practical portable oxy-acetylene welding apparatus has recently been introduced. It consists of the usual cylinder of oxygen, filled under a pressure of 10 kilos, and the acetylene reservoir, these being mounted on a two-wheeled wagon which can be easily moved from place to place even by a mere girl. India rubber tubes several yards long connect the gases with the blowpipe, which is provided with the customary safety arrangement. In addition, the welder has within easy reach a stop-cock, enabling her to regulate the flow of the oxygen and acetylene before they reach the mixing chamber of the blowpipe. It has been found that, thanks to this handy apparatus, a woman worker is able to do a multitude of small soldering jobs with great rapidity and, what is equally important, with a minimum of fatigue. The apparatus is perfectly safe, and the operators find no difficulty in using it.

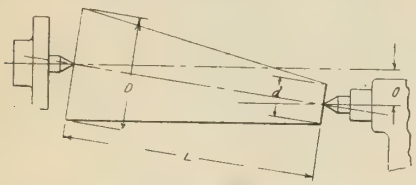
Shop Arithmetic—Problems on Taper Work

No Matter Whether You Have to be Accurate on Every Occasion, it is Well to Know How to do the Thing and Get Absolute Results

By J. H. RODGERS, Montreal

THE problem of machining tapers is one very frequently met with in the daily work of the average mechanic, and while accurate calculations are not always essential, the knowledge of the necessary principles involved in determining the proper offset of the tailstock center, the angle of inclination of the compound rest or dividing head of the milling machine, or other machine tool accessories, is often of considerable advantage to the man on the job possessed of such acquirements, thus enabling him to avoid those inefficient cut-and-dry methods that are sometimes adopted for work of this character. The advantages derived by using a few simple rules and formulæ will amply repay any effort expended in acquiring the principles of applying the same.

When speaking to a lathe hand regarding a taper, he would immediately think of a piece of metal of a conical shape as turned between the centers of the lathe. To illustrate the general appearance of a taper when turned in the lathe, the sketch is given.



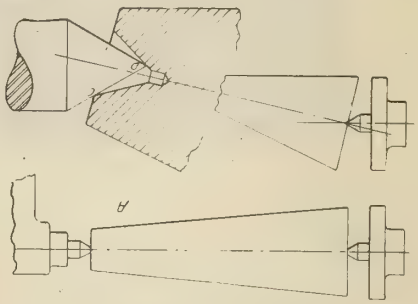
In calculations for tapers of this character, the three primary requirements are the two extreme diameters and the length included between such diameters. Suppose it is required to turn a piece of steel of a conical shape like that shown above, the length of which is to be 10 inches, the large diameter 4 inches, and the taper to be ¾ inch per foot; what would be the diameter of the small end? With a taper of ¾ inch per foot, the taper of the 10 inches would be:

$$12 : 10 = \tfrac{3}{4} : x$$

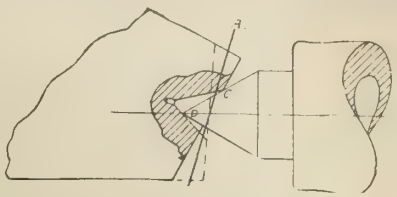
$$x = \frac{10 \times 3}{4 \times 12} = \frac{5}{8} \text{ inch}$$

Therefore, the small diameter would be 4—⅝=3⅜ inches, and the offset, indicated by 0, would be ⅝÷2=5-16 inch. The solution is based on the exact length of the tapered portion, but the accurate adjustment must be determined by actual test, as conditions are never such that the set over can be definitely determined, owing to the varying depths to which the lathe centers enter the work.

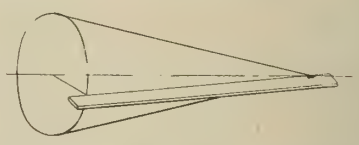
There are certain factors involved in machining tapers that do not come directly under the head of shop arithmetic, but of which it might be well to speak of while on this subject, as they are of vital importance to successful results. One of the primary conditions in connection with taper turning, is the imperative need of perfectly square ends on the work, faced at right angles to the central axis. This is made more clear by referring to the accompanying sketch.



When the centers are drilled in the end of the shaft, they form the ends of the axial center, and when the tailstock spindle is in a central position, the centers of the lathe and those of the work will coincide, as shown at A. To form the taper, however, the tail center must be moved over an amount equal to one-half the difference between the large and the small diameters, as shown at B —tail end greatly exaggerated—and in doing so, the lathe centers are out of alignment, and remain in such position while the taper is being turned. From this it will be readily seen the necessity of having true ends to the shaft. The heavy line A-A indicates the neutral line of the end, or the face as it should be when properly squared off. In turning work by setting over the tail stock, the bearing points on the tail center are at C and D, and if the edge of the shaft center is irregular, it will affect the smooth movement of the work and the shape, when turned, would be eccentric instead of circular.

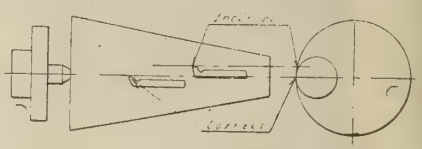


In the more modern types of lathes, that are fitted with taper attachments, this condition is eliminated, but the need of true ends should always receive the best attention. Another factor well worth mentioning and remembering, is that of keeping the cutting point of the tool in the same horizontal plane as the lathe centers. For a straight edge to bear along the full length of a taper cone or frustum of a cone, one end must coincide with the apex of the cone, as indicated in the sketch below:



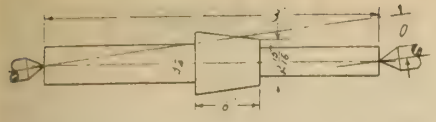
The straight edge here corresponds to the lateral movement of the fixed tool. If the tool point is on the same level as the lathe centers, or where a radial movement of the tool on the work would cause the point to pass through the axial line, the turning of the work will result in a true conical surface, but should the tool be above or below the center, the work will have slight concave shape, as here shown (greatly exaggerated).

This might be made more clear by an end view of a tool setting on taper work.



Here is shown an elevation and an end view of the work, and the importance of the above advice regarding tool position, is quite obvious.

In the case of the taper attachment, the calculations are very similar, but allowance must be made for difference in length between the work and the taper slide. It is seldom, however, that a piece of wark is required where the taper extends over the entire length of the piece, and the method of determining the set over of the center, or the inclination of the taper slide, must be governed by the existing conditions. Suppose we have a shaft 3 feet long, and a taper is desired on a 6-inch section, that has diameters of 3¼ and 2 15-16 inches, what would be the set over of the tail stock center?



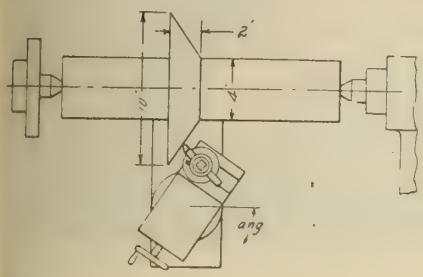
As the taper of the 6-inch section is 15-16 of an inch, the set over would be in direct ratio to the lengths, or, with X representing the offset, the solution would be:

$$\frac{5}{16} \quad 2x = 6 \quad 36 \text{ or}$$

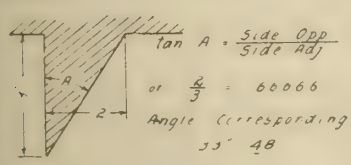
$$2x = \frac{5}{16} \times \frac{36}{6} = \frac{15}{8} = 1\frac{7}{8} \quad \text{and}$$

$$x = 1\frac{7}{8} \div 2 = \frac{15}{16} \text{ inch}$$

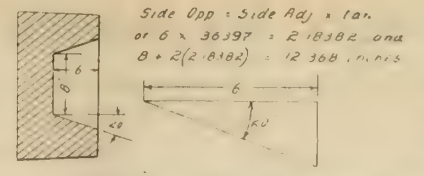
Where tapers are so abrupt that offset of the tail stock, or the use of the taper attachment is impossible, the compound rest must be brought into service, and this method permits of the lathe centers being in perfect alignment, so that more accurate results are obtained. This practice, however, involves calculations that are a little more complex than the other, but are easily understood after a few practical applications. Suppose we have a taper to turn like that shown below:



While an approximate setting could be obtained from working from the face plate, with a square and scale, the more accurate method would be to solve by "trig" for the required angle at which to set the compound rest. The solution, diagram, and the necessary calculations, are shown below:



A case may arise where the angle is known, and some of the dimensions, but the one most desired by the operator is not given. For instance, a die is required as shown below, with the angle, depth and bottom diameter given. In order that some reliable guide may be had by the operator, the large diameter should have been shown, as it is here that his cutting tool must enter the work. However, with the dimensions given, we are able to figure out quite closely the size of the large diameter. The diagram and formula are here given:



Therefore, the large diameter would be 12.368 inches, or close to 12⅜ inches.

THE ELECTRIC FURNACE

Sheffield Industrial Progress During the War

An interesting discussion on the electric furnace, bearing partly on the progress made in Sheffield in the use of this method of steel melting, took place at the inaugural meeting of the Sheffield sub-centre of the Institution of Electrical Engineers, which was held last night at the Royal Victoria Hotel. The institution has recently adopted the plan of sub-dividing its organization, and the advantages of this method were explained to the meeting by the president (Mr. C. H. Wordingham, of London). The excellent attendance at the meeting was an augury for the success of the new sub-centre. Mr. R. H. Campion, of Dewsbury, presided.

Four papers were presented: "The Booth-Hall electric furnace," by Mr. W. K. Booth; "Electric furnaces in the United Kingdom, 1918," by Mr. R. G. Mercer, of the Ministry of Munitions; "A new type of electric furnace," by Mr. A. Sahlin; and "Large electric steel-melting furnaces," by Mr. Victor Stobie.

Mr. S. E. Fedden (general manager of the Sheffield Corporation electricity department) gave an interesting resume of the growth of the use of electric furnaces in Sheffield. He said that in 1882 Sir William Siemens melted 20 pounds of steel, and thought he had done a very great thing. In 1902, pig and scrap iron were made into steel on a commercial basis. The man from Sheffield, however, was very canny, and he took some time before he would even try the experiment. The first firm who ventured to do so on any large scale were Edgar Allen and Co., who put in a single-phase furnace; and shortly afterwards Messrs. Thomas Firth and Sons put one in. These were run by motor generators, and gave very little trouble. In 1910 an Electro-Metal furnace was put in. It was two-phase, off transformers direct. They had a lot of trouble with that, but it was overcome, and then they went forward fairly well.

In 1914 they put in one furnace; in 1915, three (one of which was the first war furnace); in 1916, 11 furnaces, taking 13,000 kilowatts; in 1917, 18 furnaces, taking 14,000 kilowatts; and in 1918, seven furnaces; so that altogether they connected up, in a very short period, furnaces taking an output of no less than 35,400 kilowatts. They had the ordinary load in addition, and in three years the units sold grew from 26 millions to 172 millions, and the maximum load from 14,000 to 57,000 kilowatts. They connected up more furnaces than they had safe carrying capacity for. They had to do so on account of the war. They obtained from the Ministry a permit to put down a special telephone system, and got in connection with all the furnaces; so that, if they got a very bad run of coal or were short of plant, they could immediately ask that the units going into the furnaces should be reduced until they were able to give a full supply again. This arrangement was of very great assistance and enabled them to take on more furnaces than they really ought to have done.

Mr. Fedden analyzed some figures of output given in Mr. Mercer's paper, arriving at the conclusion that the steel manufacturers' load factor was only 15 per cent. He said if they asked anybody else what they ought to pay for a 15 per cent. load factor, they would be given a figure of 3d. to 3½d. Yet the Sheffield Corporation, at which they were always shouting on the score of high prices, had been giving it them for 6d., and practically losing 3d. a unit, for the benefit of steel-making in Sheffield. (Laughter).

Mr. Ernest Wells, of Edgar Allen and Co., said when he went to the Ministry of Munitions electric furnaces were very much over-rated. People were selling them on the principle on which one sold a pup. They were sold on the terms that anyone who bought them, no matter what business they were engaged in, could make good steel castings with them. But the output of good steel castings from the electric furnace until quite late in the war was negligible. The big bulk of castings were produced from the Siemens furnace or the side-blown converter. However, his own firm had sufficient confidence to have ordered some electric furnaces, and were going to make a shot at producing castings from them.

Mr. Travis (Sheffield) took exception to Mr. Wells' statement. He said he thought all manufacturers resented Mr. Wells' action at the Ministry. The fact was that people who had stock converters or other methods of making castings in their works, and who installed electric furnaces, had shut down their other plant and carried on the electric furnaces, which proved conclusively that the electric furnace gave them the result they required at the lowest cost. The very fact that Messrs. Edgar Allen and Co. had installed two electric furnaces, which he understood were ordered just before the armistice, showed their belief in the furnace which Mr. Wells attempted to damn to everyone else.

Mr. C. H. Rose (representing Mr. Victor Stobie), said his firm did not attempt to sell a furnace until after three years' successful manufacture of steel.

Mr. Howard (Sheffield Corporation), expressed the opinion that in many of the older furnaces the voltage was far too low. It ought to be increased by 25 per cent. This would lead to a considerable reduction in cost.

The Drawbridge, Up-to-date, in Industry

The Castle Moat of Former Years and the DrawBridge Over it Have Their Counterpart in Modern Industry Where at Times it is Necessary to Make Provision for Two Streams of Traffic on Different Levels

By J. H. Moore.

THE problem of conveying material from one department to another, throughout a large plant especially, is one well worthy of special consideration. A correct solution to such a problem may mean an enormous saving, while a hasty and not properly thought-out plan may mean, in fact usually means, a decided loss.

It often happens that two buildings are rather widely separated either by a street, railroad tracks, or other causes. Where a street intervenes there are as a general rule only two solutions to be considered, namely, the overhead bridge, or the underground tunnel. It depends, of course, on the general layout of the plant, which of the two policies is adopted.

In a case where railroad tracks come between buildings, the overhead bridge is as a general rule the solution adopted, but this idea, while a very efficient one, is also a costly undertaking. This is especially true if the cars which run on these sidings are only in place perhaps once a week, and in some cases even at longer intervening lapses of time than the former time stated. One cannot blame a manufacturer in such circumstance from saying, "The cost is quite an item."

They say that there is always a solution to any problem if you'll only keep on looking for it, but be that as it may, we have at least come across the solution to the problem we have just been discussing.

DRAWBRIDGE PARTIALLY RAISED.

At the plant of the American Can Co., Hamilton, Canada, the writer noticed a novel counterweighted bridge, which in reality is a commercialized idea of the old bastile bridge of former days. Of course, you remember your history of how these bridges spanned the moat around the fortress, and could be lifted up at will.

The same idea holds good in this case, but in place of the moat we have our railroad tracks. Fig. 1 illustrates how the bridge appears when down in place. It spans from one building to a shipping platform constructed alongside of the other building, and is operated by means of an ordinary rope.

When in position the bridge is held in place by means of a strong pin, which goes through a suitable flange on the bridge. Fig. 2 illustrates the bridge partly up. We photographed it from this position purposely, to show the counterweight space A. Readers will note that the construction is structural steel, with wooden running face. The bridge is built to stand up under heavy usage.

One would be surprised to find how easily this bridge operates. As soon as catch is released it swings up easily and smoothly. Of course, it keeps going up until it touches the building wall, if necessary.

Manufacturers will do well to study their transportation problem afresh, and see if a bridge of such style could not be used to advantage in their particular case.

DRAWBRIDGE DOWN AND IN USE.

Solving the Problem of Why is a Hot Box

The Discussion on a Paper Read Before the Canadian Railway Club of Montreal. The Paper Was Printed in Last Week's Issue

"I DO not agree with the statement made that we are farther away from the solution of this matter than we were twenty years ago, as I know that twenty-five years ago it was a common thing to see a freight train with two or three boxes smoking and others on fire, but you do not see this now.

"I have been wondering if anyone was going to say anything on what I consider to be the vital point in the whole matter. We have heard about the wearing of the white metal lining down to the brass and the serious results which follow. Now, in my belief, this is purely a question of magnetism, but if you talk to the ordinary car inspector about magnetism, you might as well talk to him about the number of feathers in an angel's wing.

"There are some metals that have the same magnetic conductivity, but there are no two metals or combination of metals that have exactly the same conductivity and when you get the bearings worn down and allow the two metals to come together in an infinitesimal, microscopical sort of a way, still they are big enough to cause a lot of trouble. In my opinion this is one of the largest elements in the whole thing.

"In so far as end wear is concerned in examining journals you will find that in turning them up they are carefully chamfered off at the end of the collar outside, but the inside is left perfectly square and the result is that we have a lot of them that are not circular getting into service.

"Some time ago I suggested that this method be changed and the inside corner of the collar be chamfered slightly the same as the outside and whenever this plan has been adopted it has saved an immense amount of trouble, particularly on new equipment. This, and the question of magnetism, are really bigger than most people think.

"I remember a case of some years ago where a big manufacturing plant required 500 coal cars for their own use. When they came to make the car brasses they picked up all the old scrap brass they could find about the place and put it in the mixer. Of course, the product looked like car brasses, but when the cars were turned out they did not run 200 miles light before they had to be re-brassed. The general manager sent for me and I put some of these brasses under the steam hammer and broke them through the centre and I found that they were more or less full of steel filings, borings and lathe chips. Apparently they did not take care enough in running their magnet through this stuff to pick out the steel and iron refuse before it was melted. When the brasses were replaced with the proper mixture the trouble disappeared immediately.

"If proper attention is given by the builders and the railway people there will not be so very much trouble with hot boxes. I do not know just what the figures are, but I am sure that the proportion of hot boxes now is not one-tenth of what it was twenty-five years ago. I would not like to think that the work of the Galena Oil men and the railway people has all been expended in vain in the last twenty or twenty-five years."

Norman Holland, president of the Holland Varnish Co., spoke briefly on the influence of the magnetic action, and the analyses of the metals in the journal bearings. In speaking further, he said:

"Mr. Gesner has brought up the question of the metals used in connection with the journals. He has referred to the electrical relations of these metals to each other. This question of the electro-positive and electro-negative relations of the various metals undoubtedly has some bearing on the question of journal troubles. The influence exerted may not be very great, but it is still quite sufficient to enter into the matter.

"I wonder to what extent the railways check up the analyses of the various bearing metals they buy? Do they know they are getting a composition that will stand the enormous stresses put on a journal bearing? Do they know what proportion of tin they get in relation to the lead used? We all know that owing to the high price of tin the tendency of the babbitt manufacturers is to increase the lead content as much as possible. These are most important points.

"There is no doubt but what the question of hot boxes can be solved to a large extent if the railways will give the matter the proper attention. Mr. McVeigh has pointed out a number of ways in which the matter could be helped. We have a factory in which we use nothing but double ball bearings. These require attention only once a year. They have now been running for nearly ten years and have never given us any trouble. Has any railway ever tried the ball or roller bearing and would it be possible to use either of these in railway equipment?"

Roller bearings had been tried out some time ago on trains of the C.P.R., but Mr. Smart stated that these had to be removed during the winter months, and, so far, had not been found successful for railroad service.

The question of cost was touched on by B. C. Gesner, who stated that the cost of journal lubrication had been reduced approximately, from 28 cents per thousand miles, on freight cars, twenty years ago, to about 4½ cents per thousand miles at the present time.

In closing the discussion the comment of G. M. Wilson, motive power superintendent at the Point St. Charles shops of the G.T.R., emphasized the importance of careful workmanship and supervision in the machine shop before the axles or the brasses were placed in the truck or engine. He said in part:

"I can say the remarks made by Mr. Booth that shop practice has something to do with the heating of journals brought to mind a case that quite recently came under my personal observation. We turned an engine out of the shop to make its customary trial run across Victoria Bridge, but before it had gone very far one of the tender journals ran hot. The wheels were removed for inspection of the journal and to all appearance it was parallel and smooth. I had it properly cleaned for further inspection and upon pressing with my finger and thumb and running them around the journal, I discovered that slight regularly space corrugations bounded its circumference.

"Either the undrilled centre bottom in that journal, or a chattering axle lathe bearing, or a combination of both, together with careless inspection, certainly caused that hot box.

"I came to the conclusion that, so to speak, if a journal is perfectly round, perfectly parallel, perfectly smooth, and perfectly lubricated, it will never run hot."

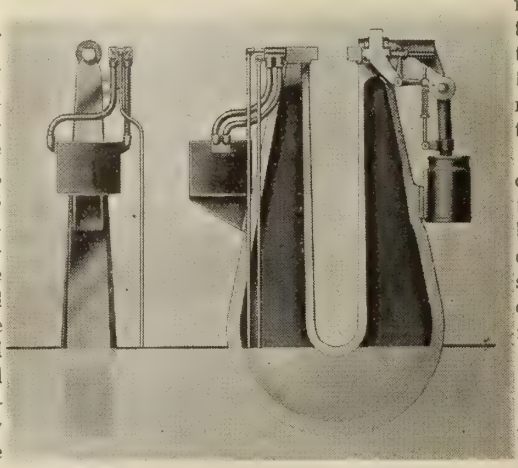
There has been considerable discussion during the past year or two concerning the utilization of Para rubber seed for oil, and it is stated that already exhaustive experiments have been made along this line. It is cited that in one instance oil from rubber seed was sold at about $250 a ton at a time when the price for linseed oil stood at $300. Experts are of the opinion that this oil could probably be successfully used in the manufacture of paints and varnishes, linoleums, soft soap, rubber substitutes, etc. In addition to the use of rubber seed for the purpose above mentioned, it is stated that experiments conducted in the Strait Settlements have clearly shown that a feeding cake for cattle and other stock, favorably comparing with linseed and other oil cake, can be produced from the residue of the Para rubber seed, after the oil is extracted, thus affording an opportunity for the development to very considerable proportions of a profitable industry in connection with the ordinary oil extraction.

DEVELOPMENTS IN SHOP EQUIPMENT

ELECTRIC RIVET FORGE

An electrical heating device for rivets, which is capable of wide application to shipbuilding boiler making and the erection and fabrication of structural steel, has been developed by the United States Electric Co., New London, Conn. The accompanying illustrations show various applications of the device. In its essentials, as shown on the portable rivet forge, it consists of a source of low potential current, a water-cooled and movable upper bridging electrode and two lower electrodes or terminal blocks. Rivets are heated in pairs and on being placed between the two-current carrying electrodes are quickly raised to a riveting heat without the formation of scale.

The forge can heat rivets of ¼ in. to 1¼ in. diameter. On two recent tests two ¾ in. rivets with 2½ in. shanks were heated in 15 seconds; two ⅞ in. rivets with 2½ in. shanks in 23 seconds, and two 1 in. rivets, with 2½ in. shanks in 30 seconds.



ELECTRIC RIVET BEATER ATTACHED TO BULL RIVETER

The following is a test made at Springfield, Mass., October 3, 1919, at the plant of American Electric Service Company:

Test, 50 rivets; total cost, 9 cents; time, ½ hour.

Size of Rivets.	Heating two at a time	Amperes (Transformers)	Volts	Amperes (Current)	Volts
1 inch	25 sec.	5¼	5500	220	190
⅞ inch	18 sec..	4¼	5000	220	175
¾ inch	14 sec.	4¼	5000	220	162
⅝ inch	9 sec.	3¼	5000	220	150

From the construction and principle of the device it is necessary to heat two rivets at once. This is a decided advantage, as the two are heated in the time taken to heat one.

One of the illustrations shows the machine adapted to the bull or gap riveters. The rivets are placed in the rivet holes cold, and the work to be riveted is moved along in front of the electrodes, which may be brought in contact with the electrodes either by the motion of the plunger or by a hand lever.

One rivet is being preheated while the other is being brought to the proper heat. By this means a continuous line of hot rivets is kept on the way to the plunger of the gap riveter during the operation.

In the case of portable riveting machines the device is designed for use with rivets not over 5-8 inch in diameter. It is made to operate in conjunction with the pneumatic hammer.

The operation is rather simple, the tool being attached to either the riveting hammer or the holder-on. Cold rivets are placed in holes shaped to size, the holder-on comes in contact with the rivet as in an ordinary case, but here the electrode is brought in contact with the head of the rivet. Heat is maintained until the desired intensity is reached, then the rivet is headed by turning the air gun around.

The electrode is attached to the side of the riveting gun, allowing two rivets to be heated at once by the use of a bridging conductor, which makes the device useful in heading rivets from one side of a plate, the outside of a boiler or in restricted spaces. Equipments are available in all sizes and for use with 110-volt and 220-volt currents.

The forge type of rivet heater was designed and built to meet the requirements of shipbuilders, structural steel builders and boiler manufacturers wherever it is necessary to use hot rivets from ¾ in. to 1¼ in. diameter, 3 in. shank; the time for heating being from seven to fifteen seconds, and at a very low cost.

The electrodes are arranged to heat two rivets at one time, delivering four 1 in. rivets per minute, which is as fast

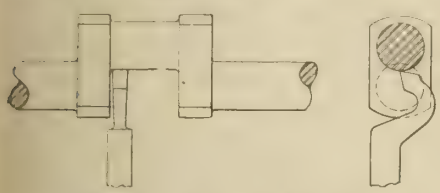
WHAT OUR READERS THINK AND DO

PARTING TOOL DISCUSSION

I have followed the discussion on parting tools with interest and profit. I think it is a good thing to have an exchange of ideas, and I hope these discussions on different topics will become a feature of CANADIAN MACHINERY.

No fair comparison can be made of the relative merits of forged tools and inserted tools, that is small tools held by a tool holder, unless each particular job is taken on its own merits.

For ordinary shop work the inserted tool is most popular and cheapest. We



PARTING TOOL DISCUSSION

learned something about parting tools during the war as Canadian machine shops cut off thousands of shells, and I venture to say that very few, if any, forged tools were used. During the war some steel makers made a special steel for cutting-off tools; this special steel was made in bars with the sides clearance on, so that all that was then necessary was to mill or shape a holder to fit the cutting-off blade which could be used up until it was tool short; all it needed was to grind the front and top clearances.

There are quite a number of other factors beside the shape and style of tools to consider in successful parting operations. The most important is the personal element. The lathe hand or operator, as we all know, given exactly identical conditions, some men will be much more successful than others.

Then there is the cutting speed, the cutting compound (if any), the material, the diameter of the job, and the rigidity with which it is held. To have a piece of work sticking out of the chuck too far always invites disaster.

The width of the tool always needs some consideration, as a rule the smaller the diameter of the job the narrower the tool that is within reasonable limits. The height of the tool in relation to the centre of the work also varies with the nature and diameter of the work.

If you get the tool below the centre of a light, spongy job the job is apt to climb over the tool; if you get it much above the centre you have to have an excessive front clearance to make it cut at all, then the first thing you know the tool will dig into the work and throw it out of the centres.

I have found that in using a parting tool on large diameters it is best to set the tool slightly above the centre, and on small work at the exact centre.

Another point is to maintain a continuous and even feed; it is not often that the cross feed can be used for cutting-off operations, they are generally too fast. To let the tool stop cutting seems to harden or gloss over the surface besides dulling the tool, so that it requires extra pressure to make the tool cut again, often with disastrous results.

ELECTRIC RIVET FORGE

(Continued from page 492)

as they are required. The rivets are brought to the proper heat entirely free from scale, and are passed on to the riveter.

The pan of the forge is designed to hold a keg of rivets in front of the operator or heater, and the rivets are easily placed by hand in the electrodes, and removed with the tongs when heated.

The operation is very simple, the conductor being operated either by foot or hand lever, bringing the electrode in contact with the point of the rivet or rivets to be heated, pressing down on the lever, and, when the desired heat is reached, the conductor goes back by removing the pressure on the lever. This method of heating rivets eliminates the following:

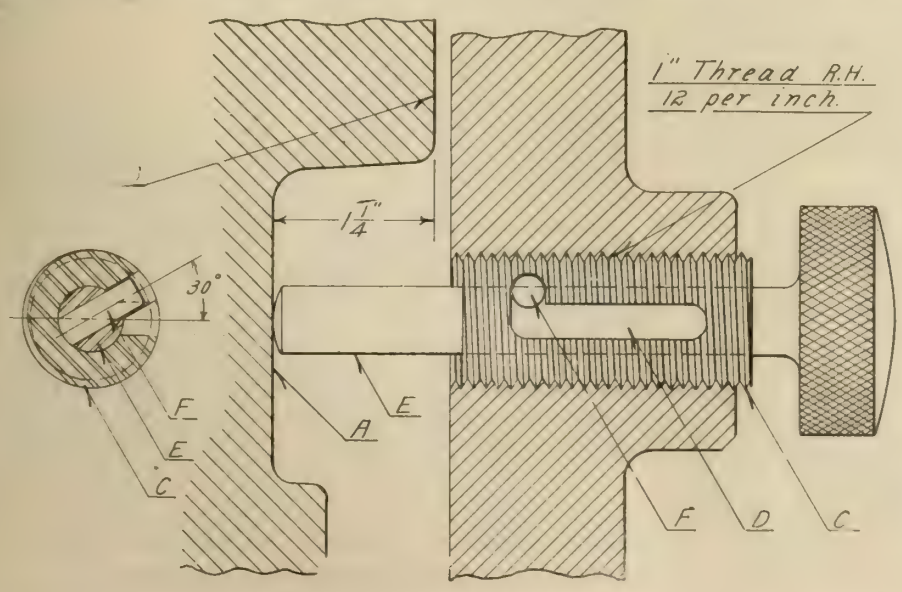
Loss of time in starting forges in the morning and at noon time.

Loss of burned rivets.

Breaking and carrying of coke and fuel for forges.

Air hose and air where same is used to blow up the fires, fittings, etc.

Smoke and gases in close compartments on ships, boilers, etc.



JIGS AND FIXTURES

Application of the Bayonet Lock

The accompanying sketch shows a practical application of the bayonet lock, adapted to a jig or fixture where ordinarily a long, clamping screw would be necessary. When the work is being removed or placed in position the pin F is at the right end of the longitudinal slot D, the central rod E being drawn back to allow the lug B to pass. To clamp the work, the rod E is pushed forward and the pin engages in the short radial portion of the slot, and the threaded bush C is turned in the usual manner.

Are You a Figure Fiend?

AT an early stage in our lives, most of us, possessed of any imagination whatever, wondered just how much we saved by cutting across lots instead of going around. A little later on another problem intrigued us; we wondered as to just what the relation between the diameter and circumference of a circle was. Fortunately, we had teachers, more or less accomplished, to enlighten us, but in the early stages of the development of mathematics and general science those of a philosophic mind were not so happily situated and perforce, they had to go it blind.

All problems having to do with the mensuration of the circle have to do with the ratio of the circumference to the diameter. To those not conversant with mathematics, it would appear that this should be comparatively simple and so it is of no absolute value required. The ratio commonly denoted as π is in its nature an incommensurable number, that is no fraction can be found which will give its exact value. The commonly accepted approximation of 22/7 is not strictly accurate, for when it is changed into a decimal fraction its value will be 3.142857°, whereas the true value to the same number of decimal places is 3.141592. A closer approximation than the fraction 22/7 is given by another fraction 355/113.

Perhaps the best proof of the fact that no vulgar fraction can be found which exactly represents the value of π is seen in a characteristic of all vulgar fractions. When reduced to decimals it will be found that after a certain number of divisions they repeat themselves thus: 22/7= 3.142857,142857, etc. On the other hand, the number π never repeats, but runs on and on as far as one cares to figure it.

The earliest idea of the number which represented the ratio between the diameter and circumference was probably the number 3. It was so at least among the Jews (1 Kings vii:23, 26), the Babylonians, the Chinese and probably also the Greeks. Archimedes made a notable advance over former knowledge of this subject, and by geometrical means which he originated determined the fact that the true ratio lay between 3 1/7 and 310/71. His method consisted essentially of calculating the length of the sides of regular polygons inscribed in and escribed around the circle.

With the renaissance in Europe more powerful means became available and the use of formulae, in themselves an algebraic shorthand, greatly simplified the labor involved in computation. One Rudolph Van Ceulen (d. 1610), busied himself with the problem for the greater portion of his life and the results of his labors were not interred with him but inscribed on his tomb. He gave the result correct to 20 decimal places and as a curiosity it may be given here:

π=3.141,592,653,589,793,238,462,643,383,279,502,88.

Since his time has arisen a class of workers known as π-hunters, π-cumputers, or circle squarers. Their labors, fruitless though they may be, are interesting from the length to which they have carried the number. A decimal number with several hundred places is common in their results and one figure of 707 places has been reached. When compared with the modest figure given above, this number seems enormous.

Various methods have been used by these investigators for the solving of their problem and much effort has been wasted by some of them in trying to reach the end of their never-ending labors. It has been definitely proved that no such end is possible, and we must be content with approximations, of whatever degree of exactness desired.

Deliveries From the Steel Mills

THE steel companies in United States are having a better time, as far as their dealings with their customers are concerned, than they will when the strike is finally settled. At present buyers are making every allowance because they know what the mills are up against. They are taking any delivery they can get and they are not complaining.

When the announcement comes out that the strike is off, the public will expect immediate recovery from the mills, and they will not be complacent with delivery schedules that are weeks and months behind.

The matter of immediate recovery after a plant has been tied up or fifty per cent. crippled is easier said than done. A steel mill is a great organization, and it is easily thrown out of gear. Capacity production depends upon men being skilled and acquainted with every successive operation.

A strike in a coal mine or a strike in a steel mill soon brings about a state where it is a hard matter to recover quickly.

Unless all signs fail the steel mills, at the close of the strike, will bump into that fickle side of human nature that prefers performance to excuses, and shipments to explanations.

The Use of Weapons

THE number of cases where it has been shown that persons had loaded weapons in their possession seems to increase in Canada. It seems to be the proper thing now to shoot if things don't go to suit you.

After every shooting there is a campaign to stop foreigners from carrying weapons. There are regulations, no doubt, to cover all this, but the fact remains that carrying weapons is a common practice.

A man who carries a loaded gun in his pocket does so because he thinks he will be called upon to use it. There are mighty few men called upon to do any shooting as long as they are minding their own business. The man who carries a gun reckons that he is going to break the law and will need a show of force to do it.

At the present time it is too easy to obtain or keep revolvers. If a man wants to fight, let the law see to it that he comes out in the open with his fists, rather than skulking up some dark lane with a loaded gun.

The State of the Market

IN CANADIAN MACHINERY of August 22, 1918, there appeared an article written by one of the associate editors of this paper on the prospects for machine tool trade following the war. The article is headed: "Should Be No Post-War Slump in Machine Tools." The heading gives a general outline of what the article had to say. It reasoned that the war machine would not come into competition with the general purpose tool, and that much of the material, from long and hard usage, was fit only for the scrap. The fact was also brought out that many firms had dropped usual lines, and large organizations built up for war purposes would be held together to turn to new lines.

It is worthy of note that every one of these predictions has turned out to be true, and it is also worth remembering that toward the end of 1918 the pessimist was abroad in the land. He was saying that 85 per cent. of the business passing was war work, and that was going to be cut off all of a sudden, and the labor market glutted.

That period of readjustment that was going to be such a nightmare, is well under way, and the blue ruin element has not yet entered into the consideration.

There is more business moving than an unthinking or a non-observant man realizes.

Business has remained good in spite of tinkering. Too much tinkering and too much non-production are things we have to guard against. They can wreck our prosperity and batter down our progress more certainly than any other element.

Are You Wasting Your Time?

NOW that the winter months are almost here, what are you doing in the long winter evenings? You say you get enough of the grind all day without continuing it at night. Quite right. But did you ever stop to think that the way to get away from the grind was to grind harder?

The manner in which manufacturing is carried on now, the speed with which operations must be performed, the way in which material must be routed, all mean that the man who is going to master the situation must be a student. What was considered a job for a standard machine yesterday is moved to a special-purpose tool to-day.

What do you read? The papers? Very well, read them. Keep informed, but make certain that your information is going to be worth something to you. You read three columns of stuff about the gruesome details of a murder or a suicide or a divorce case. What better off are you? Absolutely none.

Get a direct drive in your reading. Make it a point to be well informed about some subject. People find it a pleasure to talk to you. There are successful men on the road who do this thing continuously. They enter into a conversation and turn it to a subject on which they have gathered a lot of information. They are able to talk intelligently and they get a good hearing.

You can do the same thing in your own line, no matter what it is.

You can largely make yourself what you want to be.

---

lowed throughout the country, would lead to the bloodiest upheaval in all history, an upheaval in which they would be the first to pay the last price that men can pay for social sins.

"It is a striking fact that it is the 'radical' unions and Socialist organizations, together with some 'liberal' magazines, which today stand almost alone in defense of intelligent and civilized methods of dealing with the problems of the hour. Instead of abolishing the restrictions on free assemblage and discussions, instead of allowing the masses to express their wishes and wants through organized effort,

THE FLAW!

----Cassel in the Cincinnati Commercial Tribune

refuge is sought in terrorism, illegal suppression and organized violence. The reaction is losing its head -- and the New York "Commercial." Against the "red" campaign of evil "there must be organized one of devotion and patriism," declares the Los Angeles "Times," which goes on to say:

"We must set backfires of intelligence and patriotism. Thrift and industry must combine to fight their own battles. Against the forces of confiscation must be arrayed those of production. They of small incomes and small holdings, humble homes and small bank accounts, must not expect the so-called wealthy classes to fight for them. For not one person in a thousand is in the capitalist class, while half the producers of the country own something which the Reds through their machinations are seeking to confiscate. If anarchy were to prevail for a time, it is the persons of small incomes and the owners of single holdings who would suffer most. The very rich would be able to step across some convenient national boundary where their personal comfort would not be seriously affected. But the ones who would be hit hardest are those who have acquired through industry and thrift a small competence, a little home, a nest egg in the savings bank, who would see the savings of a lifetime swallowed in a whirlpool of Bolshevism--these would pay the penalty of their thrift and industry, while the bestial and criminally inclined would hold high carnival.

"It is during crises like the present that great civilizations in the past have disappeared."

EFFECTS OF THE PRINTERS' STRIKE

THE AGONIZING MENTAL SUSPENSE which magazine readers in general, and serial novel readers in particular, must suffer because of the printers' strike in New York, is pityingly commented upon by a facetious editorial writer, who regrets that the hero will be locked in a death grapple with the villain, while the beautiful Sylvia looks on, for several weeks longer than usual; the brave and unsophisticated country girl, battling with the vicissitudes of life in the great and wicked city, will still be undecided as to whether she should marry the rich clubman and be assured of a life of leisure. And so forth.

PART OF PAGE SHOWING HOW NEW YORK MAGAZINES GET OUT IN STRIKE TIMES.

MARKET DEVELOPMENTS

Some Canadian Firms Have Anxious Times

Hard Matter to Secure the Material They Need—Varying Reports as to the Deliveries Reaching This Country—Machine Tool Market is Brisk

MATTERS are becoming serious for some Canadian concerns which draw their raw material from the United States steel mills. There are various reports in regard to deliveries, and the best of them do not claim much over fifty or sixty per cent., while in other cases the mark is at zero. One large Toronto firm of importers and jobbers stated this week that for the first time in their history they could not find a mill in United States that would take on business for future delivery. Mills that have managed to stay open and operate even on a reduced basis have been swamped with business that will keep them covered for months to come. They become so hopelessly over-booked that their only course is to withdraw from the market for the time being.

There will be a tremendous amount of business piled up against the day when the mills state they are open to take on orders again. Some speculation is indulged in as to whether prices will stay or advance under such conditions. In some ways the war period is being repeated, in that there is a tremendous demand and a limited supply, and without Government control it is easy to see where prices may get a start. Against this it is pointed out that under the present schedule the steel companies are showing good earnings, and any move toward a higher scale would only serve to arouse the agitation of labor leaders for a share of the higher prices. The latter view of the fact seems to be the more likely one. However, there is nothing to hinder prices of material rising after they leave the mills. At present sales are not made on schedules, but on the urgency of the case. Many times it is delivery that is paid for as well as the material. Both plates and sheets were marked up this week.

The machine tool market is very active, and the big problem is the securing of shipments. Rebuilt war machinery is having a good innings in the market now, due to quick shipment and lower prices. One firm keeps a large shop busy rebuilding, and the tools are taken up almost as rapidly as they leave the rebuilding plant.

The scrap metal market is anchored fore and aft at present, and shows little sign of betterment. Speculators who bought in Canada some time ago for resale in United States later are having an anxious time just now, and losses are imminent.

MONTREAL IS ANXIOUS TO SEE THE END OF U.S. LABOR TROUBLES

Special to CANADIAN MACHINERY.

MONTREAL, Nov. 13.—The local situation has developed few changes during the past week or so, but the continued labor difficulties in the States that have resulted in reduced production and increased transportation troubles are beginning to be felt here in the delayed delivery incidental to strikes of this character. The inauguration of the coal miners' strike has been the cause of more concern, in local circles, than the walk out of the steel workers, as the latter was confined to fewer industries than would be affected by a general curtailment of coal supply. However, no serious condition has yet arisen here, but dealers and manufacturers are watching American developments very closely, as the next few days will decide the question one way or another. In some respects the Canadian mills have benefited to the extent that calls upon their lines have been somewhat heavier than formerly, and the volume of business placed reflects the inability to obtain similar products from American sources, within a reasonable time. The general demand for industrial finished steel, however, is not excessive at the present time, and with a few exceptions, the pressure of United States strikes has not been seriously felt in this locality. Navigation is gradually showing the near approach of the closing season, as fewer vessels are coming to the port, but it is expected that official closing will be as late or even later than last year. General business activity continues brisk, more particularly where this is not dependent on American supplies. The movement of machine tools is of fair proportions and would be more so but for the difficulties that surround the shipping and transportation of equipment. The metal market is nominal in ingot business, but finished lines are very quiet, as a result of the impossibility of obtaining supplies. Warehouses are virtually out of sheets, and no galvanized line can be secured. What little comes through is immediately transferred to previous buyers. Old material dealers are listlessly waiting a revision of industrial conditions in the States and few look for better conditions until affairs are more settled.

Sheets Hard to Get

Ingot metals are comparatively hard to get at present and the volume of sales are well distributed in small lots and in no instance are consumers buying very far ahead, content to purchase for immediate needs only. The difficulty at the moment is the securing of requirements for finished products, sheets are almost impossible to get and warehouses are completely stripped, with no definite knowledge as to when a supply can be obtained. Under these conditions dealers are content to let quotations stand as they are, as present prices can only be considered nominal, every sale being made on its own individual merits. Prices quoted, however, are a fair average of the present market. In lead sheets, local dealers are quoting an advance of 50 cents per hundred lbs., the lighter sizes selling for $10.75 and the heavier sizes for $10.25 per hundred lbs., with the usual charge for cut sheets.

Delivery the Problem

The outstanding feature of the ma-

chine tool operations for the week is the difficulty and the uncertainty associated with delivery of equipment from the United States manufacturers. This condition is the one that probably impresses a person here as to the growing seriousness of the strikes in the States, factors that prevent or interfere with the regular schedules of production of machinery and ultimate delivery. During the past week the revival of inquiry for used equipment has reflected the inability to secure new tools for early delivery. Dealers state that they could materially increase their sales if they could give some definite assurance of date of shipment. Many customers, realizing the conditions that exist, are satisfied to place their orders and rely on the dealer to get the tools through as soon as possible.

Local Movement Only

The combination of circumstances has resulted in a very inactive scrap market. The present trade is largely local in character, and the requirements are generally for small supplies delivered regularly, few consumers acquiring stock for future needs. As a result of the recent strikes in the States the shipments of scrap to American mills is approximately nil, and this condition will probably continue while industry is so unsettled. The critical point will be reached before this goes to print and subsequent activity will depend on the attitude of the Government and the miners' organization. Sales are based on prevailing conditions and prices quoted are only nominal, but a fair average of what the dealers are willing to pay.

POINTS IN WEEK'S MARKETING NOTES

The Willys Corporation at Elizabeth, N. J., are planning to get an organization together for an output of 500 cars daily.

Shipments of plate, sheets, etc., from the U. S. mills do not improve and Canadian manufacturers are having trouble in getting enough material to keep their plants going.

The scrap market is more or less stagnant. Speculators who bought in Canada a short time ago to sell in U. S., have not made money. They have lost on their speculation.

Some steel offices in this district can now show a fifty per cent. or slightly better delivery schedule.

Rebuilt machinery in the market now is moving out quickly.

The coal strike, according to Pittsburgh, is not going to help the steel strike, as the steel mills have big supplies on hand.

It is estimated that the steel strike has cost the mills now an entire month's production.

Prices of pig iron are advancing sharply. None of the producers seem to care to take a definite lead in boosting prices, but are quite content to trail along and sell at increased prices.

STEEL SHORTAGE IS MORE ACUTE

Shipments Do Not Improve—Demand for Machine Tools is Still Strong and Increasing

TORONTO.—Unless the reported improvement at the steel plants soon finds a sequel in decidedly improved shipments coming to Canada, there are firms that will have to shut off certain of their departments. That is not a matter of speculation, but an absolute fact. The supply of steel from the mills on the other side is still well down, as against a demand that is increasing rapidly.

The Sale of Machinery

The representative of CANADIAN MACHINERY noticed a nice line of lathes and shapers on the floor of one of the Toronto showrooms, and inquired how it was that they managed to keep that machine. The salesman merely pointed to a white chalk mark on the other side of the tool, which read "Sold." It could be sold a good many times over, for the demand for good machine tools is too keen for the available supply.

As showing the demand for machinery in Canada, the following can be given as an illustration: One firm took in a very large amount of used machinery of the better sort from the war shops. They scrapped any that had been used too roughly, and engaged a machine shop to go ahead and rebuild the remainder. It is coming out of that shop now at a pretty fair rate, but it has no chance to accumulate, as it passes out into use again about as quickly as it comes on the floor of the warehouse.

As noted some days ago in these columns there are firms that are losing business because they cannot give deliveries that meet the needs of the trade. A customer wants a two or three month delivery on a certain machine and it is no use to promise it. In many cases where houses act as exclusive agents, they have nothing else to offer as a second choice. And, as is usually the case in a strong and rising market, the matter of price is not the consideration it used to be. Salesmen state that very seldom do they have to meet this argument seriously. Where a man or a firm really wants a machine tool, delivery is four-fifths of the business at present, and it is delivery that the makers are uniformly weak on just now, with small signs of improvement.

Drew Another Blank

Several Toronto buyers and warehouses drew another blank from the expected shipments of steel from United States strike zone. A nice shipment of tubes came through to one of the firms, and the sizes showed that the mill is operating, as they were specials as well as standards. Dealers here state that operations of tube mills are about forty per cent., but there are others whose goods are held back yet who seem certain that thirty per cent. would be nearer the mark.

And in passing it might be noted that just at this season of the year there is a great demand for tubes, especially of the two and three inch sort. Repairs are being made to heating plants in schools, churches and other establishments, and strange as it may seem, many of the repairs always get shunted off until they are ready to light up the fires for the winter season. Prices have not been increased, although there is a feeling in the market that a higher price could be secured for tubes, but there is no disposition on the part of the big mills to alter prices owing to the strike, and so the jobbers have nothing to work from. They may secure some premiums, though, while the list remains the same.

A New Experience

But there is a shortage, and it is increasing, in regard to steel of all sorts. Here is the experience of one warehouse that operates on a large scale at several points in Canada: "In the last two months we have had a tremendous tonnage turned back on us by mills that we have been selling for years. They will not entertain the prospect even of taking on any business. We never had this happen in all our experience. It looks to us as though there would be a very large amount of business stacked up for the mills when they get down to production again. "The situation," our informant continues, "is very much the same as it was during the war How then, do they calculate to hold prices for next year? Unless there is regulation, and that hardly appears likely, I believe the tendency will be upward in spite of the satisfactory earnings that steel companies are showing under present unsettled conditions."

Other dealers do not share this view. They point to the labor unrest that is existing at the moment in the steel industry of United States, and ask you what effect it would have to raise prices now. They answer their own question in the next breath by stating that it would simply mean that demands would be made for higher wages. These people contend that raising prices would be simply to renew all the agitation that has been gone through with for the past three or four months. The latter view of the case seems to have the better ground of being somewhat near to the real situation. For the present, though, both plate and sheets have been marked up.

Some of the shops in this country are suffering already from the shortage of material. Stove makers feel the need for sheets already. Another firm making metallic furniture practically clean-

ed the automobile steel out of one warehouse to tide over the period of scarcity. It is only a temporary account, and staves off the day when material will be missing entirely.

"While they do not state so openly," remarked one dealer this morning, "the mills give us the impression that they are out of the market entirely until this strike is won. They never suggest a compromise, their attitude being win or break."

A Dull Scrap Market

There is almost no action at all in the scrap metal market. There are a few speculators who are looking for action to relieve them of their embarrassment. It has been, in some quarters, a favorite form of speculation to buy up quantities of scrap here and ship to United States, holding there for better values before releasing for sale. Shipments that went across the line some weeks ago are not going to make money. They are going to lose it.

There is very little business going on now, either between dealers and sellers or mills or other consumers. All the coppers are weak, in fact, almost stagnant. There are none of the white metals that are showing any particular strength in the present market.

WILLYS CORPORATION PLANS FOR AN OUTPUT OF FIVE HUNDRED PER DAY

Special to CANADIAN MACHINERY.

NEW YORK, Nov. 13.—Eastern machine tool builders are, almost without exception, comfortably well off as to business on their books. Some companies are losing orders because of inability to make fairly prompt deliveries. On some lines deliveries are from a month to three months off. Current business is fairly good, although there has been a slight falling off in inquiries during the past week, due, perhaps, to the uncertainties incident to the labor troubles.

The Magor Car Corporation, Passaic, N.J., is in the market for about 25 metal working machines, most plate punches, shears, radial drills and similar machines for car work. Five wood-working tools are also inquired for. Several of the big deals in the East which have been pending for some weeks may soon be closed. Most important of these is the list issued a few weeks ago by the New Departure Mfg. Co., Bristol, Conn., for several hundred tools. The Willys Corporation, Elizabeth, N.J., is about to let contracts for new manufacturing buildings and is interviewing many machine tool engineers in preparing a list of its tool requirements. As the output of the plant is eventually to be 500 or more automobiles a day a very large quantity of equipment will be purchased. The General Electric Co., Schenectady, N.Y., has taken no action at this writing on its recent list, totalling more than 100 tools, but is expected to place orders soon. This is only a part of the General Electric Co.'s requirements for the near future.

Another large prospective buyer is the Stevens-Duryea Co., Chicopee, Mass., which will re-engage in the automobile manufacturing business. The trade expects that a large list of equipment will soon be inquired for.

Crane builders are very actively competing for business, very often at the expense of prices. While several of the crane-building plants have fairly good order books, much of the business has been taken with very little profit. During the war several new crane companies came into existence, and the productive capacity of the country is now in excess of the need. The Midvale Steel and Ordnance Co. has placed an order for several cranes for its Cambria works at Johnstown, Pa., with the Alliance Machine Co., Alliance, Ohio, and the Morgan Engineering Co., Alliance, Ohio, has received an order for five cranes for a new steel rolling mill at Canton, Ohio.

COAL STRIKE NOT REGARDED AS DECIDING FACTOR IN STEEL STRUGGLE

Special to CANADIAN MACHINERY.

PITTSBURGH, Nov. 13.—The coal strike inaugurated Saturday, Nov. 1, found nearly all the steel mills with stocks of coal equal to from two to four weeks of consumption, and the Government distributing authorities determined to avoid, if at all possible, any idleness of steel mills on account of the coal strike since that might lend encouragement to the iron and steel strike. No immediate occasion was found for furnishing coal to steel mills. The railroads seemed to be moderately well supplied, so that some of the commandeered coal, involving all that was in transit, was available for distribution, and this has been given to public utilities, as having the first claim. The Connellsville region was not affected, its coal production, apart from that converted into coke in the region, amounting to several hundred tons a week. The strike did not affect other non-union regions either, and a few small union mines remained in operation, while after the first day of strike there were occasional instances of union miners returning to work.

Increasing Steel Production

At the end of last week, the seventh of the steel strike, production of steel was at the rate of nearly 70 per cent. of the rate just before the strike. Production during October averaged 60 per cent. or a shade less. At the height of the strike, the third or fourth day, production was down to about 50 per cent. of the pre-strike rate. As the strike is now waning rapidly it is important to remember that before the strike production was at considerably less than capacity. From the middle of May there had been a continued increase in production, but just before the strike production was still only between 80 and 85 per cent. of rated capacity. This restriction in output was due in part at least to scarcity of labor, though the manufacturers also held labor inefficiency responsible.

Up to date the restriction in steel production by the strike has amounted to about three weeks of production at the rate before the strike, hence at the lowest estimate the entire restriction is going to exceed a month's production. The great problem with steel manufacturers now is not the strike, which is disappearing with sufficient rapidity, but production after the strike, as in many mills working organizations have been greatly impaired in efficiency and it is likely to be a long time before everything is working smoothly again. During the strike the customers of steel mills are very sympathetic and accommodating, but after the strike they are likely to become more or less peremptory in their demands, probably having the viewpoint that with the strike over they ought to be getting better service than ever.

The Wheeling district is still closed practically tight, but operations are increasing at a fairly good rate in the Mahoning Valley. All the blast furnaces in the valley were closed, but now about one-third as many are operating as before the strike and steel production in the valley is up to 20 or 25 per cent. Three of the four large steel interests at Youngstown are now shipping some steel, while the fourth does not seem to be shipping any, although it is making some pig iron and steel ingots.

Pig Iron

Values of pig iron have stiffened sharply. In some districts there is regular trading, showing almost constantly advancing market prices. In the Pittsburgh Valley district there is relatively little trading and market prices are not strictly defined. The producers, in the main, are indisposed to sell, and all or most of them are holding back, evidently with the idea that as price advances are unpopular it is better to let somebody else put the market up, and then simply come in and sell at the market price. Buyers willingly pay sharp advances over the March 21 schedule for such small prompt lots as they must have, and while prompt iron does not usually make the market, if advanced prices for prompt become well established it may be found easy, later on, to sell for first quarter or first half at those prices.

Foundry iron was $26.75, valley, by the March 21 schedule. A fortnight ago it sold at $28.75 for first quarter, but lately there are no sales for next year. Prompt lots have brought up to $33, valley. Malleable was sold at $30, valley, to a customer, who wanted foundry, which the seller could not furnish, and the $30 price on the malleable was regarded as representing a concession. Basic, which was $25.75 by the March 21 schedule and has been in light demand lately, has sold at $29 for prompt. Prompt lots of Bessemer have sold successively at $28.50, $29 and $29.50, the March 21 price having been $27.95. As closely as the market can be quoted it stands as follows: Bessemer $28.50 to $29.50; basic, $28 to $29; malleable, $30 to $31; foundry, $30 to $33, all f.o.b. valley furnaces, freight to Pittsburgh being $1.40.

In the East there is a clear cut market, No. 2X foundry (2.25 to 2.75 per cent. silicon) being $34.10 to $35.10 delivered Philadelphia. Buffalo has sold little, but the market there seems to be $32 to $33 at furnace.

Furnaces claim their costs readily justify these price advances, but consumers are not convinced. However, it seems clear that the advance is not all to be attributed to the iron and steel strike, perhaps not even the major part of the advancing tendency. Pig iron was advancing somewhat before the strike, and the strike has not affected the merchant furnace production of pig iron nearly as much as it has the operation of steel mills with their blast furnaces. One factor in the pig iron market undoubtedly is that last spring and summer consumers were striving to reduce their stocks, and carried the process too far, as is usual in such cases. Furnaces blew out until production was below consumption, and then came the strike. That the strike is not in itself responsible for all of the present shortage in pig iron is shown by production reports, to the effect that production of pig iron by merchant furnaces was 90 per cent. as heavy in October as in August. The strike curtailment, however, was more than 10 per cent., being probably fully 25 per cent., production having been increased up to the time of the strike, September 22.

Steel Supplies

There is not as great a pinch in steel supplies as might have been expected in the circumstances. Many consumers are getting along fairly well, though probably near the end of their stocks by this time. In some instances the scarcity is acute. Nails are extremely scarce. In automobile manufacture the scarcest steel item is springs for upholstery, and next comes strip steel, bars and sheets following in turn.

The English Market.—If any firm with a specialty of almost any kind that they would like to sell in England, will communicate with Mr. Furniss Clarke, Room 63, 364 University St., Montreal, he can probably place the same for them.

U.S. SCRAP METAL

The scrap situation is stronger. The lack of pig iron is making cupola scrap sought after, and prices have advanced. Following are reports from various U.S. points:

Pittsburgh.—The deficiency in pig iron has boosted the price for cupola scrap. A sale of 500 tons was made at $28 delivered. Dealers are looking for $30 on this grade. A good market is looked for in steel making and other grades when the labor situation is more settled.

Boston.—There has been an active buying market during the week, and a general advance in price has been noted. Among the grades most in demand is No. 1 machinery. Turnings and foundry scrap have advanced, and cast iron borings have sold at $16.

New York.—Cast scrap and heavy melting both show renewed activity with enhanced prices. No 1 heavy cast is quoted $24 f.o.b. New York, and heavy melting at $15.75 to $16.50. No. 1 machinery has advanced $1.25.

Philadelphia.—A sale of 15,000 tons heavy melting to the Lukens Steel Co. at $20, delivered, has cleaned up all this grade obtainable. All other grades are in good demand, especially cast scrap, borings and turnings. Clean cast borings brought $18 delivered.

Cleveland.—While there is active enquiry, there is little trading going on. The tone is strong, but a settlement of the coal and steel strikes is necessary to get business moving.

PIG IRON TRADE

There is a general advance in the pig iron market. Spot iron is exceedingly difficult to obtain, and premiums are being willingly given to get it.

Following are reports from United States points:

Pittsburgh.—What little iron is available for shipment between now and the end of the year is quoted at $30, furnace for No. 2. Malleable is in good demand and 1,000 tons for first quarter was sold at close to $31 furnace. For first half 1920 one interest has booked 100,000 tons foundry iron, but no price is available as yet.

New York. — The scarcity of iron for prompt shipment, has boosted prices. The minimum for Eastern Pennsylvania iron, 2.25 to 2.75 silicon, is now $33, and Central Pennsylvania iron of the same grade has sold at $35. Low phosphorus has been looked for more eagerly, and coppering bearing iron brought $36 furnace. There is a little Virginia iron, 1.75 to 2.25 silicon, available for shipment during the next month, quoted at $31 furnace.

Boston.—There has been a wild rush after any iron that could be obtained for prompt shipment, and prices has been a secondary consideration. Iron in some cases advanced as much as $3 in a day, and found ready purchasers. Panic over the coal strike was the cause of this. Some re-sale iron has been offered at $39 to $40 delivered.

VERY HIGH PRICES ARE PAID AT SALES OF U.S. WAR MACHINERY

A CANADIAN, who is at present engaged in the machine-tool business in Philadelphia, writes to CANADIAN MACHINERY regarding the sales of used war tools that have been taking place.

These sales, he states, are part of the features which make the market hard to gauge, as most of the tools are bought by consumers (users in this case), thus taking trade away from the dealer and manufacturing concerns.

This feature makes it appear that the market is dull, yet the number of tools (and the prices they are bringing) put on the market by the Government, shows the market to be very active.

Most dealers were at the sales Thursday, and I think one or two machines only were bought by them. The dealers were out of the run as the tool users were bidding in competition with the dealers and went a whole lot higher than a dealer could afford to go and make profit. Some of the tools brought practically new and some over new prices.

It is one of the psychological effects on open auctions that the user will outbid, and this to the extent of paying excessive prices at an auction, the prices he would not even consider if he were in a machine showroom, without feeling in duty bound to call the nearest policeman to arrest the dealer for profiteering. The high prices of new tools is also boosting these sales. It is very hard now to talk to a man about new tools until he has tried everywhere around to find a used tool.

The particular sales to which reference is made here was at the plant of the Eddystone Rifle plant, which, during the war, was one of the best equipped rifle manufactories in the country, its production running as high as 7,000 rifles per day. Since the war it has been used as a storage plant, and various Government equipments from other plants have been shipped in.

This sale comprises the machinery and material from the Fox Gun Co., the equipment from the Bethlehem Loading Plant and about 500 machine tools from the Eddystone Rifle Plant itself, in all there being about 900 machine tools and ment of every description.

All sales were made f.o.b. cars at the plant.

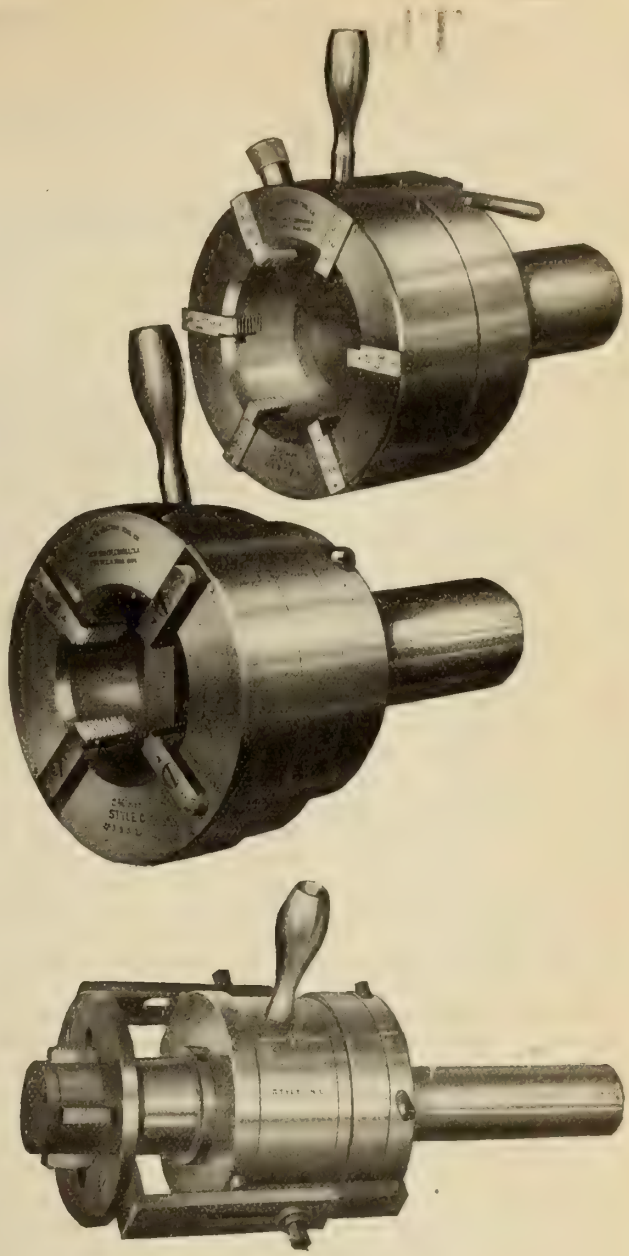
A GOOD BOON

"Geometric Tools are a good boon in our business. Always reliable and sure of turning out a class job; in fact, I don't know how we could secure a decent output without them."

This is what the Works Inspector of a London (England) shop says. He adds that they are making screw and small parts for air craft, and have quite a lot of Geometric Dies in constant use.



Because of the fact that Geometric threading tools are "a good boon" in the thread cutting business, the majority of screw machines and turret lathes are equipped with Geometrics.

The Week's Events in Montreal Industry

Roderic J. McLean, consulting mechanical engineer of Montreal, has just returned from a successful two months' business trip to the British Isles.

The St. Lawrence Iron Foundry of Montreal are gradually disposing of their munitions equipment and they anticipate returning to active foundry operations early in the coming year.

The engineering firm of Peacock Bros. will shortly remove their offices from 285 Beaver Hall Hill to 175 Delorimer Ave., where the manufacturing plant is located and operating under the name of the Clyde Engineering Co. Considerable expansion has taken place recently and still further development is anticipated.

It has been announced that H. H. Vaughn has retired from the executive of the Dominion Bridge Company, to take a more active interest in the operation of the Armstrong, Whitworth of Canada, Limited, of which company he was appointed a director some few months ago. Mr. Vaughn is also actively associated with the recently organized General Combustion Company.

The Oil Engine Works of Canada, 29 Prince St., Montreal, will shortly move their plant to Iberville, Que., where they will occupy a portion of the plant of the Rapid Tool and Machine Company. When in Montreal the bulk of the machine work on the engines was performed in outside shops, and the assembling of the units was not all that could be desired. In their new location nearly all of the work will be carried on at the assembly plant. There is a steadily increasing demand for these engines.

That normal Trans-Atlantic shipping is not yet an accomplished fact is shown by the recent announcement of the British Ministry of Shipping regarding the early 1920 sailings to the West Indies, that had been arranged by the White Star-Dominion Line. The S. S. Megantic was to have been placed on this route for a number of pleasure cruisers, but the powers-that-be have seen fit to decide otherwise, and this vessel will remain on her regular route throughout the winter, to assist in relieving the heavy service that is expected during the next six months.

A. W. Swan, who has been associated with the Canadian Ingersoll-Rand Company, of Sherbrooke, for the last two years, has resigned to take over the position of assistant-secretary for the Engineering Institute of Canada, in the head office at Montreal. Mr. Swan graduated from the University of Toronto, with a B.A.Sc. in 1917 and entered the production department of the Can. Ingersoll-Rand Co. Since March, 1918, he has been assistant in the publicity department, in charge of technical journal advertising.

Owing to the large number of returned men that are taking advantage of the rehabilitation classes throughout the district, it has been found necessary to increase the educational facilities. The large factory recently constructed by Caron Brothers, for the manufacture of American shells, has been acquired by the Government and the draughting classes from the Montreal Technical School, and a large portion of the mechanical class, to the number of about 400, are receiving instruction at this plant. Much of the former equipment is being utilized for the purpose.

The finding of the Board of Conciliation, after investigating the claims of the wireless operators on the Great Lakes, has been announced, and as a result, substantial wage increases will be granted to all wireless operators on the lakes service. The Marconi Company, however, have decided to apply the revised rates to every operator throughout their entire service, in which about six hundred men are engaged. The new rates of pay will mean increases ranging from 50 to 100 per cent. The Board commended the splendid spirit of the Marconi officials, in not alone appreciating the reasonable demands of the men, but also in their immediate willingness to extend the new wage scale to the greater number of operators on the ocean service, not within the present finding of the Board. A recommendation is under consideration for a revision of the present contract with the Government, as regards the operation of wireless stations on the Great Lakes. The contract figure of $3,500 per year per station is less than half that required to maintain efficient service.

The City of Outremont will adopt a new type of snow plough for cleaning the streets during the winter. The device is simply a gas-driven rotary snow fan, similar to those used on the railroads, mounted on sleigh runners and drawn by two or more horses. W. H. Stadig is the inventor and the machines are being built by the Canadian Fairbanks-Morse Co.

Chas. Trawford, of Trawford and Company, chain manufacturers, of Walsall, England, has been in Canada during the past month, visiting their Canadian agents, Thos. Moore and Sons, of 224 Lemoine St., Montreal, with the object of studying the field here for the purpose of developing trade in this country.

The Marconi Wireless Company of Canada have removed their main offices from 173 William Street, (the plant location), to 11 St. Sacrament St., Montreal, in the heart of the business district.

G. D. Robinson, who was for twenty-five years with the Canadian Pacific Ocean Service, and European freight agent when he severed his connection recently, has now opened offices in the Coristine building, Montreal, room 511, where he will carry on a business of steamship freight broker, shipping, forwarding and chartering agent.

During a spell of stormy weather last week along the coasts of Nova Scotia considerable damage was done to shipping, and telegraph communications. Quite a number of fishing boats were wrecked or driven ashore, the signal station at Liverpool was blown down, and the three-masted schooner Audrey was wrecked on the rocks at this point.

Demonstrations are now being carried on, at 235 St. James St., Montreal, of a new type of crude oil burner, known as the "Rex." The primary purpose of this device is for the use in the ordinary coal stove or furnace for domestic heating, although the intention of the inventor is to adapt these burners to general industrial as well as domestic use. They operate satisfactory either with natural or forced draft.

The St. Lawrence Sugar Refining Company have just recently equipped three of their six boilers with oil firing apparatus. These three boilers will be operated in direct competition with an identical battery (coal fired). Close check will be kept throughout a period of several months to determine the economic value of oil as a permanent fuel. Tanks have been erected for an oil storage capacity of about 55,000 barrels.

R. M. Rook, who for the past five years has been associated with the Metal Thermit Corporation of New York, has been appointed general foreman of the St. Lawrence Welding Company. Mr. Rook has had a wide experience in welding work of every description, and was directly responsible for the successful repairs on what is considered the largest job yet accomplished by the thermit process. This was on the frame of a large stone machine, the weight of which was approximately 75 tons, requiring about 4 tons of thermit. Nearly seven weeks were required in preparing the mould.

T. W. Rogers has joined the staff of the St. Lawrence Welding Company of

Montreal **TORONTO** **Winnipeg**

Montreal, and will have the position of general sales manager of the company. Prior to his recent appointment Mr. Rogers was eight years with Darling Bros., four years as a travelling salesman and the last four as purchasing agent. He was formerly with the heating division of Taylor Forbes Co. The tank development of the St. Lawrence Welding Company will necessitate additional selling organization and Mr. Rogers will have full charge of this department.

At a recent meeting of the Montreal Board of Trade considerable opposition was advanced regarding the proposed advance in wharfage rates that the Harbor Commissioners intend putting into effect at the beginning of the year. It was decided that the council of the Board of Trade interview the Commission to see what can be done as to the withdrawal of the proposed advance, and if this cannot be done to suggest that the matter of the increase be deferred for a time so that the board may have time to bring the whole matter to the attention of the Government.

The St. Lawrence Welding Company of Montreal, have acquired a property adjoining their present plant, which they are now preparing for the installation of the equipment necessary for their tank manufacturing enterprise. Plans now under way will provide this company with adequate facilities for making any size of tank for industrial or domestic purposes. Several machine units have already been ordered and negotiations for others are in progress. The new tank shop will take care of all classes of work up to ¼ inch thickness of plate. The company is continually adding to their general equipment; the machine shop has been enlarged, and by the first of the year they will be in a position to take on almost any class of repair work—welding or machine, or both. Their portable electric welding outfit is so mounted that it can be taken to any section of the country where local apparatus is not available for this purpose. The company are now accepting tank orders for delivery after the first of December.

The Oil Engine Works of Canada, operating for the past few months at 29 Prince Street, Montreal, will shortly move their plant to Iberville, Quebec, taking over a portion of the plant now occupied by the Rapid Tool and Machine Company. They are building the Hvid line of oil engine in 6 and 8 h.p., principally for the farm trade. M. L. G. Vincent is the managing director.

The Dominion Bridge Company will utilize the plant of the St. Lawrence Bridge Company at Rockfield, for the building of the pulp and paper machines, a post-war development that promises to grow into extensive proportions. They also anticipate the building of a grey iron foundry for the making of the large number of castings that will be required in these machines and the turbo-equipment that they are now building.

Realizing that the price of building materials will show little, if any, decline for some indefinite period, the Improvement League of the City of Montreal has decided to take immediate steps to relieve the housing problem in the city. At a meeting held in the Windsor Hotel last week the League passed a resolution to the effect that a committee be formed from the executive, and others chosen by it, to prepare a definite scheme of housing, to draw up a definite plan of amendments to the present housing law and to lay before the municipal authorities a practical system of managing the loans either to individuals or corporations. An additional function of this committee will be to press for the completion of the housing commission, which is not yet at full strength. The City Administration hope to complete the personnel of this body before the close of the year, and an active campaign of building operations is expected in the spring.

W. A. McCallum, who has been assistant to the vice-president of the Canadian Tube and Iron Company, and assistant to the president of the Canadian Rolling Mills, and the Colonial Wire Manufacturing Company, has resigned from these positions to accept the office of vice-president to F. E.

Smith, Limited, of Montreal and Toronto, a firm doing a large domestic and export trade in iron and steel refractories.

Last Saturday afternoon, Canadian Vickers, Limited, launched from their yard at Montreal, the seventh vessel that they have completed for the new merchant marine of the Canadian Government. The ceremony was performed by Mrs. Alex. Johnston, the wife of the Deputy Minister of Marine and Fisheries. The latest addition to the Canadian Merchant Marine will have the name of the "Canadian Spinner," and the vessel will be, in all respects, similar to all the others that have been launched from this yard, her dimensions being: 400 feet in length, 52 feet wide, and a moulded depth of 31 feet, and with a deadweight cargo carrying capacity of 8,350 tons. Following the launching a reception was held in the general offices of the company, many notables being present.

WILL MAKE RANGE BOILERS AND TANKS

John Wood Mfg. Co. Make Product That Will Withstand Heavy Pressure

The Canadian John Wood Manufacturing Company of Consnohocken, Pa., are busy at their new Canadian premises, Coxwell Ave., Toronto, getting into shape to commence manufacturing their product in this country.

The firm make range boilers, the seams and heads of which are fastened by electric arc process. They also make air reservoirs and steam receivers by the same process. Much of the machinery used has been developed by the firm themselves as a result of their manufacturing experience. All kinds of pressure-containing vessels have been made by the firm, and tensile tests made of the finished products have shown failure to take place in the sheet, before the weld was affected.

The efficiency of the weld as determined by a British authority is 92 per cent., and this is the figure which their calculations are based upon. However, as shown above, the practical efficiency is higher than this figure, being over 100 per cent. as compared to the solid metal.

Roentgen rays are now used to test the quality of cast metal and discover any internal defects. They offer an excellent method of determining the influence of aluminum and tungsten on steels. Castings an inch and three-quarters thick may be penetrated by the rays disclosing blow holes and similar flaws.

A contemporary says: "Did you ever see a spectacled waiter?" Now, suppose we take note of that question and see what specimens of spectacled waiters we can locate.

"News," Dallas, Texas.

A personal experience that most of us have had lately.

DOMINION TO OPEN UP NEW COAL MINE

In Order to Get Coke Supply For Operating the New Plate Mill

SYDNEY.—"I foreshadowed extensive developments in the Steel Corporation's activities on my arrival in Sydney the other day," said President Mark Workman. The time has come now to announce an important undertaking.

Bonar Point, on the north side of Sydney harbor, where the Dominion Coal Company has land areas, has been selected as the starting point for new coal mining operations to be carried into the company's submarine areas. High-grade metallurgical coal for the new plate mill is the objective. There will be, of course, no diminution of the coal output on the south side of the harbor. That, too, will be increased.

"It will be remembered," continued Mr. Workman, "that the sulphur content in the coal supplied to the Steel plant was the subject of lengthy litigation before the formation of the Dominion Steel Corporation, some years ago. This impurity exists to a more or less extent in all Nova Scotia coals. In the case of the areas which our company intends to open up the content of sulphur is less than one per cent. The immediate reason for the sinking of the new mine is the imminence of the operations of the new plate mill. The quality of steel required in the manufacture of that mill's product is of high grade, and only the finest metallurgical coal should be used in its preparation."

In Mr. Workman's opinion it is obviously a policy of wisdom on the part of the Steel Company's executive to ensure quality in the building up of the materials for an industry which will undoubtedly mean much to Cape Breton, as it foreshadows the inauguration of steel shipbuilding on a huge scale. It is quite within the range of possibility that the building of ships in the Province of Nova Scotia will be second in importance only to that of the coal mining industry.

The plans which have been prepared for the new mining activities involve the expenditure of approximately two million dollars, and provide for the most modern equipment procurable.

A large number of houses will be erected for the employees, and it is not difficult to see that the new expansion will place a large sum of money in circulation in this district

Announcement of Special Interest

to users of

Drop Forgings

THE Dominion Forge & Stamping Company have sold their two Stamping Plants.

This means that the entire resources and energies of the Company will be devoted to the Drop Forge Industry.

Extensive additions are being made to their Forge Plant to take care of the increasing demand for drop forgings in Canada.

This Plant is one of the largest and best equipped drop forge plants on the continent; and to maintain this position in the industry the company decided on this policy of concentration.

Forgings are made to customer's blue prints and specifications. Inquiries are solicited.

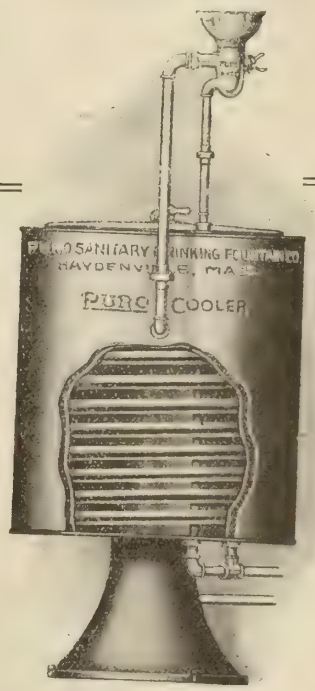
McKENZIE BROS.
18 St. Alexis St., Montreal, P.Q.



Victoria, B.C.—Admiral Jellicoe arrived at Esquimault on the battle cruiser "New Zealand.' This begins his Canadian tour. He will go to Vancouver, and return from there to Victoria, after which he goes to Ottawa. He will confer with the Dominion authorities on naval questions, and give his advice if requested. The admiral is accompanied by Lady Jellicoe.

C.G.E. Invade Stratford.—The factory of the Mooney Biscuit and Candy Co. has been purchased by the General Electric Company, who are overhauling and fitting it up. They expect to have 200 employees working by the end of the year, and will employ 700 when fully organized.

Leaside Plant Nearly Demolished.—The buildings at Leaside, belonging to the United States Munition Board, are being rapidly torn down. There are about fifty men at work on the job, and the material is being piled on the ground in readiness for shipment to the U.S. The new building, known as the C plant, which it is stated cost $2,000,000 to build, will soon be in the hands of the wreckers.

Canadian Traffic League.—The annual meeting of the Canadian Traffic Managers' League was held in the rooms of the Canadian Manufacturers' Association recently, and the following officers were elected: Hon. Pres., J. E. Welsh; Hon. Vice-Pres., T. Marshall; Pres., A. W. Bell; Vice-Pres., F. W. Dean; ec.-Treasurer, A. H. Thorpe; Executive Committee, S. B. Brown, G. P. Ruickbe, N. Boyd, F. A. Nance and R. Halliday. There were about 60 members present.

Workmen's Compensation.—Figures given out by the Workmen's Compensation Board, for the first ten months of the year, show an increase in amount of compensation awarded, though accidents were fewer in number. The average number of accidents monthly, were 3,897, though October showed 4,329. The amount paid out was $2,859,448. The total for the year is expected to be well over the 1918 figures. The reason given is the general increase in wages.

Fuel Controller Appointed.—Mr. H. A. Harrington will be Ontario's Fuel Controller for the coming winter. Sir George Foster recently wired Sir William Hearst, asking the Provincial Government's co-operation in connection with the coal situation, brought about by the strike in the U.S. The Minister under whose department the fuel controller works, turned the job over to Mr. Harrington, who is peculiarly fitted to handle it.

Chemical Development in Saskatchewan.—What may easily become one of Western Canada's leading industries is about to be opened up on the shores of Whiteshore Lake, near Oban. The Whiteshore Chemical Company has been organized to work the sodium sulphate deposits of the lake. The deposit is shown by analysis to be 97 per cent pure. Pulp mills, by using this ingredient, can increase their by-products from twelve to forty, one of them being artificial silk. There are 92 pulp mills in Canada, so the company has a big field. A by-product of sodium sulphate is stock salt, which is a substitute for Glauber. This will be only one of many other by-products.

INDUSTRIAL NEWS

NEW SHOPS, TENDERS AND CONTRACTS PERSONAL AND TRADE NOTES

TRADE GOSSIP

U. K. Trade Commissioner Here.—Mr. Harrison Watson, Chief Trade Commissioner to the United Kingdom, is visiting Canada to interview manufacturers who are interested in export trade to that country. He will be in Toronto till Thursday, Nov. 14th.

Protest Against Factory.—The Canadian Collapsible Tube Company, which purposed building a factory on the site of the Parkdale Assembly Rooms, Lansdowne Avenue, has incurred the wrath of the residents on that street. A deputation of them waited on the Board of Control to protest against the erection of the factory.

Ask Government Control of Ferries—A delegation from Windsor has gone to Ottawa to try and secure Government control for the Detroit-Windsor ferries. Parliament will be asked to amend the customs act under which ferry companies operate in Canadian waters. The company can at present charge any fare it likes, as it is operating without license from the Dominion authorities.

Ready to Award Contracts.—The Norton Co. of Worcester, Mass., have started work on the factory they are going to build in Hamilton. The first buildings will be one of three and a half storeys, 50x100 feet, and a second two storeys high, 60x160. The company will manufacture their well-known line of grinding wheels and machines.

St. Thomas May Have No Gas.—Eighteen cars of coal bound for the gas plant at St. Thomas have been seized while in transit, and given over for the use of the B. & L. E. Transit Company. This was under an order of the U. S. Fuel Administrator. This may result in the stoppage of the gas plant. Mr. Caughell, manager of the Gas Company, has taken the matter up with the Ontario Fuel Controller.

Canadian Loco Retains President.—At a meeting of the directors of the Canadian Locomotive Co., held for the purpose of taking action on the resignation of the president, Mr. F. G. Wallace, the Board insisted on Mr. Wallace retaining office. A six months' leave of absence was granted to Mr. Wallace, and it is understood that the active management of the company's affairs will be left to Mr. Wm. Casey, the general manager.

Lyall Shipyard For Sale.—The Lyall Shipyard in North Vancouver is advertised for sale, there being no further work in sight for it. The yard was started for the purpose of building wooden ships, and 40,000 tons of these vessels were constructed. During its building activity, the yard consumed 22,000,000 feet of Douglas fir, and spent $2,500,000 in wages. At its busiest period it employed 1,400 men.

Mr. Workman at Sydney.—Mr. Mark Workman, president of the Dominion Steel Corporation, was in Sydney recently inspecting the progress of the new plate mill. He denied the rumors of negotiations looking toward amalgamation with the Nova Scotia Steel and Coal Co.; stated that the new mill would be operating in a few months, and announced the immediate commencement of mining in a new coal area. This is at Bonar Point, on the north side of Sydney Harbor, and the coal from there will be used in connection with the new plate mill.

Building at Hamilton.—Engineers of the Norton Company, one of the new industries recently landed by Industrial Commissioner C. W. Kirkpatrick, at Hamilton, have been in the city awarding contracts for the erection of the Norton Co. buildings. These will be located at the foot of Lottridge Street and will include one 50 by 100 feet, three and a half stories high, and one 60 by 160 feet, two stories high. The new company will manufacture grinding wheels and grinding machinery. The contracts will probably be let on the cost plus system.

Railway Board Reserves Decision.—On the application of the Canadian Manufacturers' Association, demanding that the express companies be compelled to carry electric light bulbs at first-class rates instead of double rates as at present, the Board reserved its decision. The express companies claimed that owing to the bulbs being very light, and occupying excessive space, they were not profitable to carry. The chairman said that he could not accept the idea that express companies should carry only what they wished. They were a public utility, and as such must perform the services the public demanded of them.

TENDERS

The town of Saskatchewan is about to propose by-laws for the following equipment: new pumps, about $7,000; 4,500 k.w. turbine, about $60,000.

The Chemical Products Corporation, Ltd., Toronto, are considering the erection of a plant in Belleville at an estimated cost of $1,000,000.

For the erection of a new school on Greenwood Ave., Riverdale, Toronto, the advisory committee of the Board of Education have recommended a sum of $200,000 to be placed in the estimates for 1920.

The Lignite Utilization Board of Canada is calling for tenders for briquetting machinery. Specifications and information can be obtained from the Secretary of the Board, at their offices, 80 St. Francois Xavier street, Montreal, and tenders must be in by December 14th, 1919.

MARINE

Fort William.—The Nichols Chemical Company are about to erect a 600-foot dock and loading hoists on the mission. The dock will be located near the Grand Trunk Pacific property.

Cleveland.—Owing to a combination of heavy weather, together with a low temperature that made the handling of ore difficult, there are about twenty-five steamers waiting for cargoes at Duluth. Several steamers which were from twelve to twenty-four hours overdue have arrived safely.

Collingwood.—The Collingwood Shipbuilding Company have carried out successful trials on the "Canadian Gunner," the fourth vessel built by them recently, and she will be handed over to her owners immediately. She was built for C.G.M.M., and will sail from Montreal about the 15th November.

Port Arthur.—In the recent heavy wind and snow storm on Lake Superior, fifteen vessels, including the Assiniboia and the Huronic, were compelled to seek shelter behind islands. The steamers Glen Ellen and Glen Lyon, which were considerably overdue and the cause of much anxiety, have arrived safely at Fort William.

Washington.—Due to the strike of bituminous coal miners, orders have been issued to discontinue coaling of

foreign vessels in American ports. The U.S. Government have been advised that it is just possible to take care of American requirements, so all other vessels will have to obtain their bunkers elsewhere, presumably Canada.

Cleveland.—The end of the lake season is nearly at hand. More than sixty hulk freighters have been sent to their winter quarters. There is a scarcity of cargoes. The cold weather in the Northwest has held up the ore movement. Steamers are taking cargoes to hold, as there is little storage room on the docks, and furnaces are unable to take it.

Government Fleet Profitable.—During the course of an interview with a deputation from Collingwood, the Hon. Mr. C. C. Ballantyne, Minister of Marine, made some interesting statements. He informed the visitors that during the time the vessels so far delivered to the Government had been operating they had made sufficient profit to pay their own cost price. Furthermore, the Government, if it so wished, could dispose of any of their vessels at a profit. All the vessels so far built on the Great Lakes were booked up until June next. The fact of the Government having their own ships available had been a very helpful factor to the export business of the country during the difficult times following the armistice.

PERSONAL

Mr. James Arnold, at present works manager of the James Smart plant at Brockville, has been appointed assistant general manager of the Canada Foundries & Forgings, Ltd. The Smart plant is a subsidiary of the Canada Foundries. Mr. Arnold has been works manager since January last..

The death occurred at his late residence in Toronto on Thursday, October 30th, of Charles Seymour Archibald, sales representative of the Nicholson File Co., Port Hope, Ont., in his sixty-fifth year. Born at Halifax, N.S., of Loyalist descent. He went West in the early days before the building of the C.P.R., later returning to Nova Scotia, where he conducted a wholesale and retail hardware business at Antigonish, under the name of Archibald & Whiddon and later Archibald & Sweet. Later he became connected with the Portland Rolling Mills and Maritime Nail Works of St. John, N.B., and in 1906 moved to Toronto and from that time to the time of his death was sales representative of the Nicholson File Co., Port Hope. He was well and favorably known by all the hardware and iron and steel trade of Canada and will be mourned by a wide circle of friends. He was married in 1883 to Margaret A., daughter of L. J. Crowe of Truro, N.S., and is survived by his widow and six children. Miss Jean at home. Mrs. C. V. Earl, of Toronto; Mrs. G. N. Dalton, of Montreal; C. P. Archibald, of Charles P. Archibald & Co., machinery dealers, Montreal; Lloyd M., of the Dart Union Co., Toronto, and Dr. C. H., of Toronto.

A Little Act of Courtesy That is Good Business

BY simply mentioning CANADIAN MACHINERY when writing to our advertisers you will be doing something which will prove of three-fold benefit.

First—It will benefit you because it enables the advertiser to immediately associate your enquiry with the product advertised, resulting frequently in quicker service.

Second—It will benefit the advertiser because it enables him to identify and classify enquiries and to give credit where credit is due.

Third—It will benefit **your** paper because in the records of the advertiser it will receive the credit for your enquiry, instead, perhaps, of some less deserving medium.

We are always grateful for favors of this kind. It costs the reader nothing, and yet as we said before, it is of three-fold benefit.

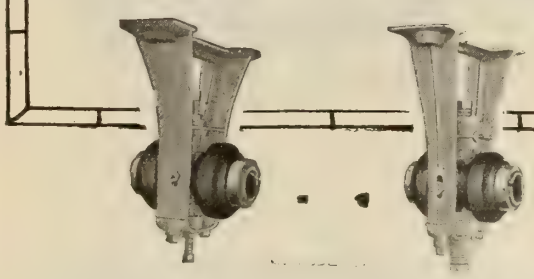
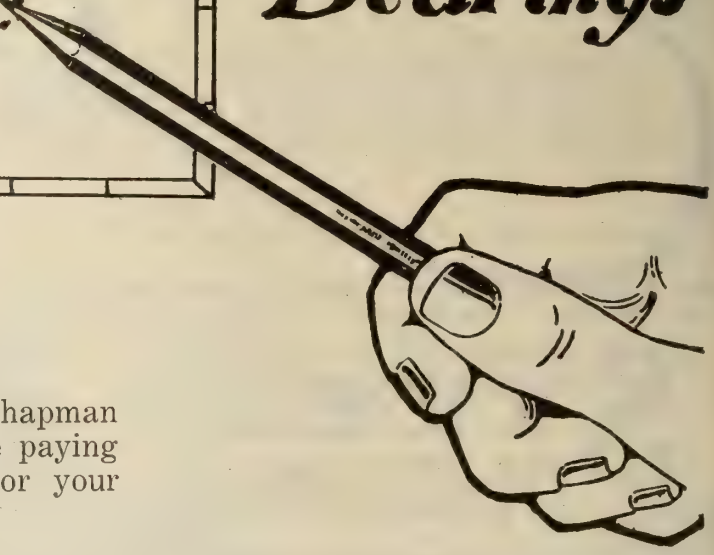
Chapman

Double Ball Bearings

You are paying for them even though you may not have them!





UNLESS you have bearings of the Chapman Double Ball Bearing type you are paying for them without getting anything for your money.

You are paying for them

—in power lost through friction, common to ordinary bearings.

—in lubrication expense, which includes the cost of oil and wages.

—in costly delays caused by hot boxes.

—in expensive rebabbitting.

Can you afford to delay installing Chapman Bearings in your plant in view of these facts?

Chapman Double Ball Bearings Save 15% to 40% of Your Total Power Cost.

Save 95% in Lubrication.

No Hot Boxes—No Rebabbitting
Dust Proof—Dirt Proof
Drip Proof.

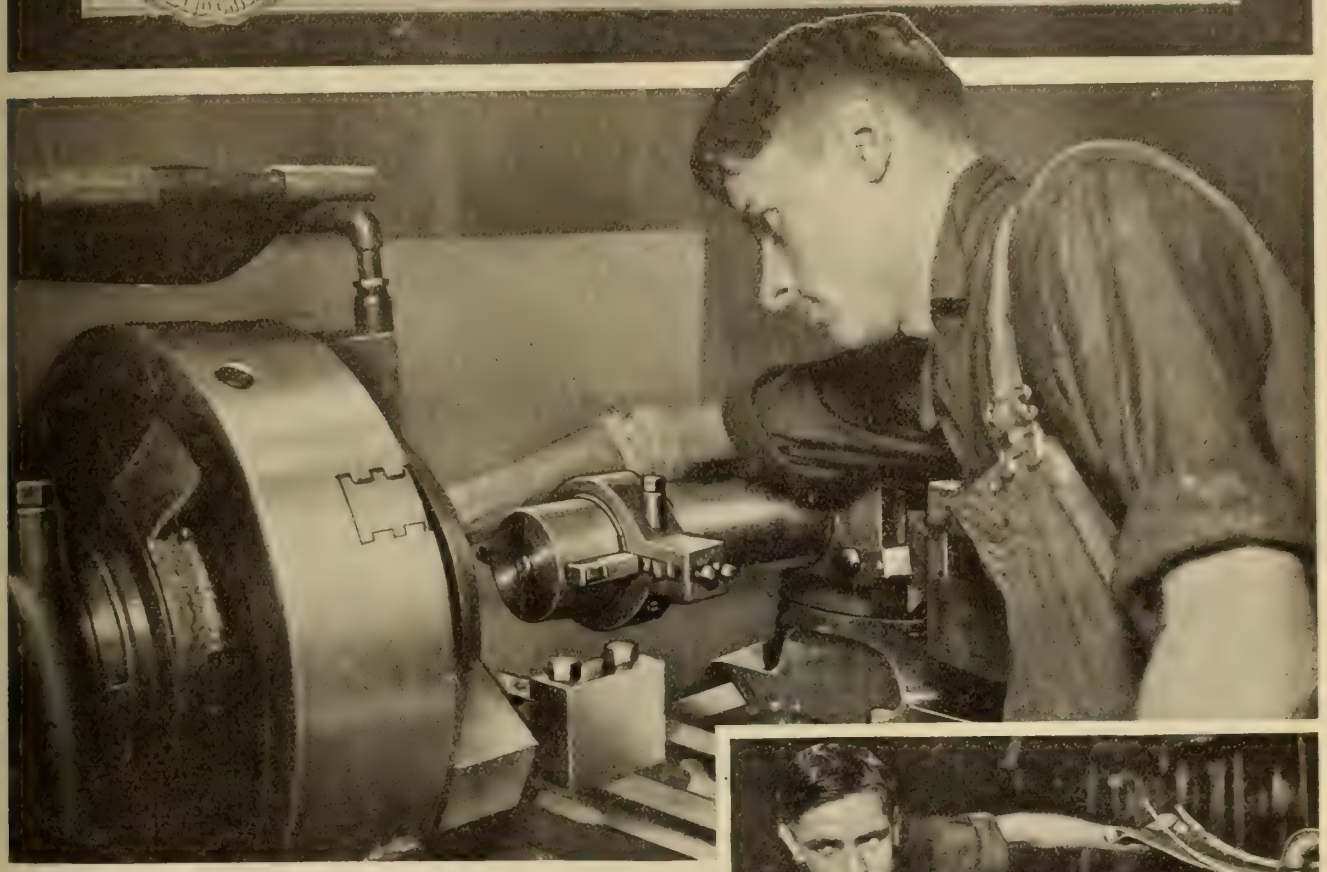
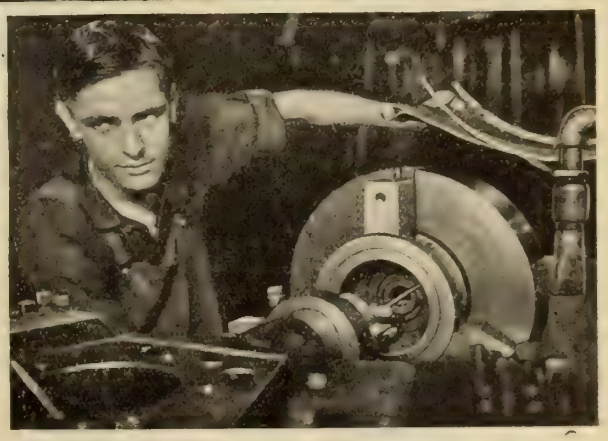
KELLY PRODUCTION TOOLS





KELLY REAMERS

Reduce Spoilage 99 Per Cent

A large New York State gear manufacturer had been using Kelly Reamers for only three weeks when he permitted us to take these photos. In that time they had reduced spoilage on large gear bores just 99 per cent.

Production was interesting also. One large Kelly Roughing Reamer was removing 7/16″ on the diameters of steel gears. It stood up over a period of five days and four nights, machining in all 4,950 gears without need of resharpening. The Kelly Finishing Reamer for the same job removed 0.020″ with a tolerance of plus or minus 0.001″, and stood up for a similar length of time.

This company is now using Kelly Reamers on practically all turning machines. And the Kelly Service Man is regularly on the job to see that these tools are giving all they were built for. **Write for Catalog J-3.**

THE KELLY REAMER CO., CLEVELAND, OHIO

Stewart Furnaces Get Positive Results

CONTROL of temperature is the essential factor in the successful heat treatment of metals. If this control is not positive, the results are uncertain and unsatisfactory. Modern shop practice and steel heating requirements demand precision—every stage of the operation must be predetermined and definite—no "guess work" goes.

Stewart Furnaces guarantee positive temperature control, with positive results in quality and quantity of production. They are delivering reliable service in thousands of industrial plants throughout Canada and the United States. There could scarcely be more severe tests of heat treating furnaces than are met and successfully solved day after day by Stewart equipment in these plants.

You can put **your** heat treating problem up to Stewart Furnaces, and be assured that it will be done exactly as you require it. You run no risk in trusting Stewarts with your expensive dies, tools and parts or other material.

More than a hundred standard types and sizes designed for modern heat treating. If none of these meet your requirements, we will build one that will. The co-operation of our expert furnace engineers is at your service.

New Catalogue of the Stewart Line of Furnaces soon to be ready

Eighty large size pages giving features of Stewart furnace construction, and showing in detail the complete line of Stewart Furnaces, Forges and Heat Treating Equipment.

A number of our specially built Forges for unusual uses are shown in this catalogue.

Two new lines of Oven Furnaces and Cylindrical Furnaces for High Speed Steel are described and illustrated for the first time.

Valuable heat treating information. An attractively printed, effectively illustrated book you will want for reference.

Mail a request on your letterhead.

For All Purposes

THO designed originally for supplying air to cupolas and forges Sturtevant steel pressure blowers are now used for all purposes where pressures up to 16 ounces to the square inch are to be maintained; and where air is to be forced for long distances. Regularly built with horizontal discharge but can be readily made for down blast or up blast. Built in all sizes and may be belt, motor, engine, or turbine driven. Operating and upkeep cost is remarkably low as proven by actual performance in many long term (30 years and more) installations. Design and construction are typically Sturtevant—supreme! Blast wheel is made of refined steel and galvanized to prevent rust. Wheels are accurately balanced and run smoothly when driven at high speed. Bearings are each cast in one piece and are lined with highly durable non-heating white metal. Write for catalogue.

McCrosky

McCrosky WIZARD Quick-Change Chucks and Collets

WIZARD production is continuous output on many jobs. On any job they will pay their own cost in a short time.

The tools are changed in rapid succession, without stopping the spindle for a moment and while running at any speed. Will more than double your drill-press in one continuous operation.

With the WIZARD you can drill, ream, counterbore, tap, set studs, etc.

Think what it means to turn out completed jobs with only one handling of the work. It means cutting out costly lost motion which eats up your profits. It means that a WIZARD outfit enables a girl to do more and better work than two men, the old way.

It means keeping your plant busy when the less efficient plant is having a hard time to make ends meet.

Read the full story of the WIZARD and other McCrosky Cost Cutting Tools in Efficiency Book No. 6. Yours on request.

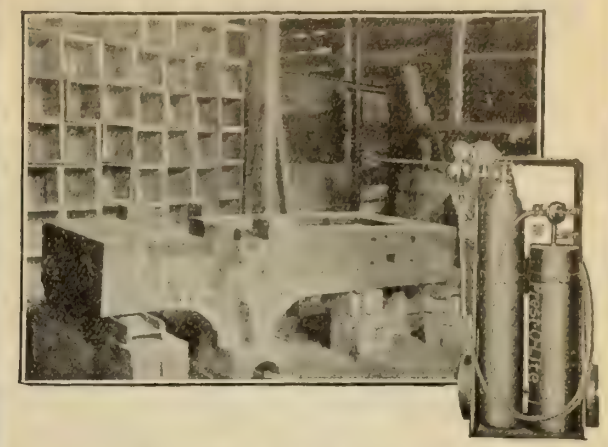
Oxy-Acetylene Welding and Cutting



This $3,000 Casting Saved from the Scrap Pile

Illustration shows a 5-ton Bolt Header Frame, recently repaired by the Prest-O-Lite Process at the Brantford plant of the Steel Company of Canada.

This casting, which is valued at $3,000, had two cracks, one 15-in. long by 6-in. thick, and the other 12-in. long by 6-in. thick.

The saving on this one repair was sufficient to pay for the entire welding outfit many times over.

Prest-O-Lite PROCESS

employs both gases (acetylene and oxygen) in portable cylinders. Prest-O-Lite Dissolved Acetylene is backed by Prest-O-Lite Service, which insures prompt exchange of full cylinders for empty ones. Provides dry, purified gas, insuring better welds, quicker work and lower operating cost.

Apparatus consists of an equal pressure blow pipe, automatic regulators and gauges, and all necessary equipment. Adaptable for oxy-acetylene cutting by the addition of special cutting blow pipe.

Thorough instructions are furnished free to every user of Prest-O-Lite Dissolved Acetylene. Any average workman who understands metals can learn the welding process quickly and easily.

We will gladly send illustrated literature and interesting data showing actual instances of savings made by others. It may suggest valuable ideas to you. Write for it.

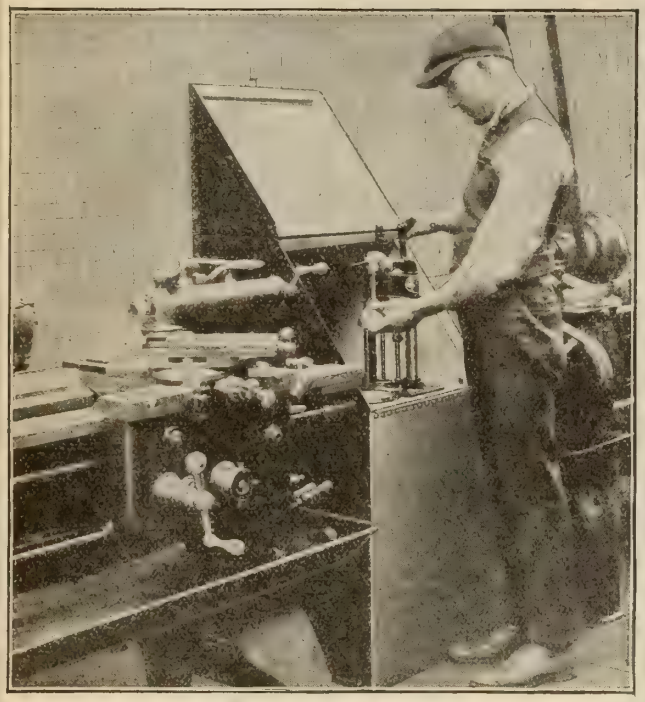
Prevent Idle Time
of Men and Machines



By placing Bowser Lubricating Oil Cabinets in departments where oil is used.

There is no going back and forth to the oil room, no spilling, no wasted oil, no fire risk from the oil storage.

Save the Oil

The oil supply can be stored and handled as systematically as raw materials or finished parts—income checked, distribution measured, charged and recorded.

Write for literature, explaining why and how Bowser Systems pay for themselves, many times over in saving of oils and labor.

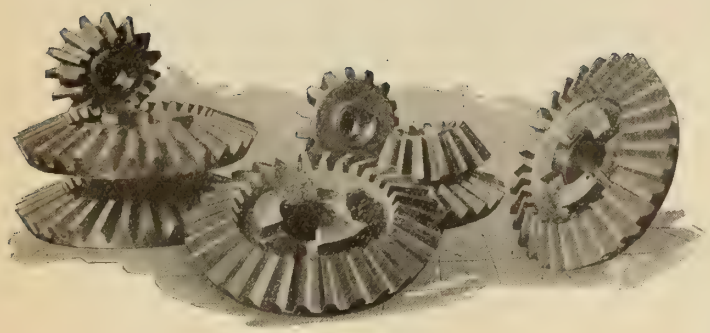
Bevel Gears



With Accurate, Generated Teeth

Hamilton Gear Co., Ltd.

Van Horne St., TORONTO

You Don't Give— You Lend

In deciding how many Victory Bonds you will buy, remember this important point—you are not giving—you are lending to your country!

You are lending at a good rate of interest.

You are lending on the highest security.

You are lending to maintain your own and your country's prosperity.

In your own personal interest you should make strenuous efforts to buy as many Victory Bonds as you possibly can.

You couldn't put your money in a better place.

You want to save money—everybody does.

It is the only way to get ahead.

And Canada needs to borrow your money to bridge the gap from War to Peace.

It's your duty to lend.

Take the proper view of this Victory Loan.

Say to yourself—"I am going to buy all the Victory Bonds I can pay for now and in the next ten months."

What if it is an effort to pay for them?

Look ahead a little.

Think of what you will own when your Victory Bonds are finally paid for!

Every cent you pay on your Victory Bonds you lend to your country—you save!

Remember that, and

Buy Victory Bonds

A Plant Equipped in Every Detail to Suit Your Every Need

STEEL PRODUCTS

Open Hearth, Basic and Acid, Electric and Alloy Steels.

CASTINGS

For Ships, Railways, Rolling Mills, Gears, Machinery and Ingots to 35 tons.

RAILWAY SPECIALTIES

Penn Couplers, Bolsters, Truck Side Frames, Draft Gears.

FORGINGS AND BILLETS

Heavy Ship Forgings, Locomotive and Car Axles, Miscellaneous Forgings.

PLATES

Plates and Heavy Sheets to 30 inches wide, Soft and High Carbon, Automobile Plates and Sheets.

AGRICULTURAL STEEL

Soft Centre and Solid Plow Steel, Harrow Discs, Shovel Steel, Cultivator Blades.

DOMINION FOUNDRIES AND STEEL, LIMITED
HAMILTON, CANADA

HACK SAWS AND TOOTH SHAPES

Right down at the bottom of cheaper cutting costs is the shape of the tooth. Years of experiment and actual working tests have given us the "Standard" shape tooth. It 'cuts quicker and lasts longer."

And here's the reason. As a saw is used the points are worn off and the "contact area" of the teeth on the work becomes so great that enough weight to make the teeth "bite" crushes or breaks the blade. In other words, "the saw is dull."

Another thing: In the acute or "positive" angle tooth the leading edge points in the direction of the cut, it's always "digging in" under the surface and most likely to strip. The negative angle tooth simply scrapes off the metal and does not actually cut at all. The hook tooth is under the same handicap as the acute angled tooth. In all unusual teeth the "contact area," the friction producing surface, is greater than with the "Standard" tooth.

The easiest, surest way to get economy in Hack Saws is to use Starrett Blades with the Starrett Chart. Send for Catalog No. 21 "3"

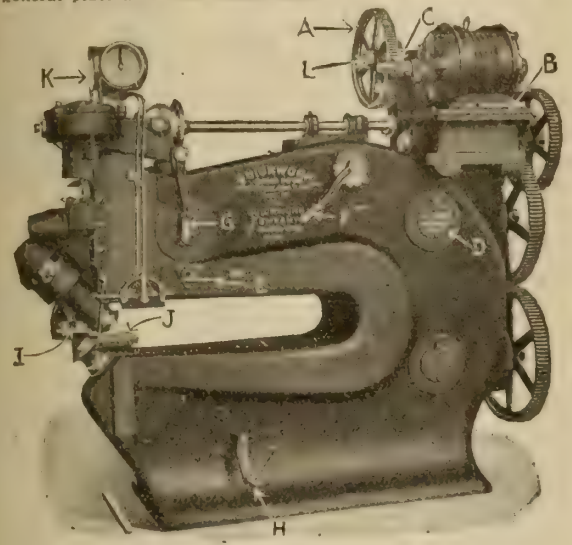
"QUICKWORK"

Registered in U.S. and Foreign Countries.

ROTARY SHEARS

MADE IN 7 SIZES.

Cut all gauges of sheet and plate metal up to 1 inch thick in straight or irregular shapes and openings without cutting in from side of sheet. Leaves square, true edge that requires no finishing. Used in building ships, boilers, tanks, cars and general plate and sheet metal work.



Patented June 3rd, 1913

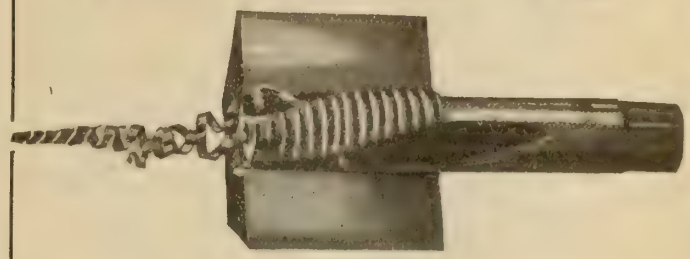
SAVES 50% TO 90%

Eliminates Oxyacetylene Cutting and Plate Planing.
Write for Catalogue No. 60.

THE QUICKWORK COMPANY, ST. MARYS, OHIO, U. S. A.

Cable address: "QUICKWORK."
Codes: W. U. and General.

THE "SEMPLE" TAP



(Patent Applied For)

A SCIENTIFICALLY CORRECT CUTTING TOOL

makes tapping a pleasure

The Most MODERN,
The Most EFFICIENT,
The Most ECONOMICAL.

Send for a "SEMPLE" Sample Tap. Made in any thread
Special Taps for blind holes.

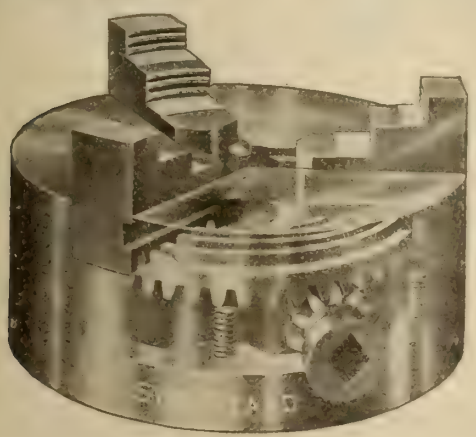
SWEETLAND CHUCKS

They satisfy the mechanics because they stand pat on everything he requires. They have jaws that don't slip.
As one Customer says: "The Non-Slip Clutch with the Bulldog Grip."



Send for 12-C Catalogue before placing your next order

The Hoggson & Pettis Mfg. Co.
New Haven, Connecticut, U.S.A.

Sold by Geo. F. Foss Machinery & Supply Co., Ltd.
305 St. James Street, Montreal

We wanted something original— this is what we got

BOTH in these operations and half another — I'll show you later — completed in the time our old taps took to do one; that, I guess, is why we continue to use your Victor Collapsible Taps."

It was the often-heard story of time saved, of costs lowered, of all threads clean and smooth. And it was pleasant to hear.

Victor Tool Company
Waynesboro, Pa.

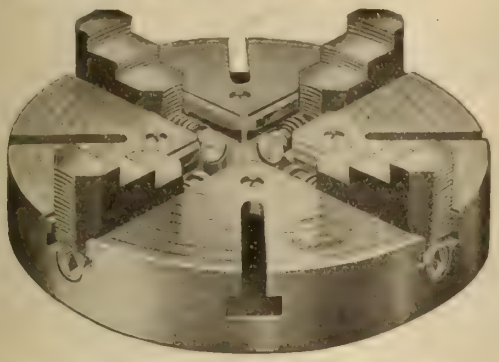
ALL STEEL

INDEPENDENT CHUCKS

are not an experiment—they have come to stay. They are a necessity with the modern machinery and high-speed steel cutting tools.



THE UNION STEEL BODY CHUCKS

are well designed and have all the elements of strength and durability for which they are designed. We make other types in steel also, including the Geared Scroll Chucks and the Geared Scroll Combination—all designed for heavy work and hard usage.

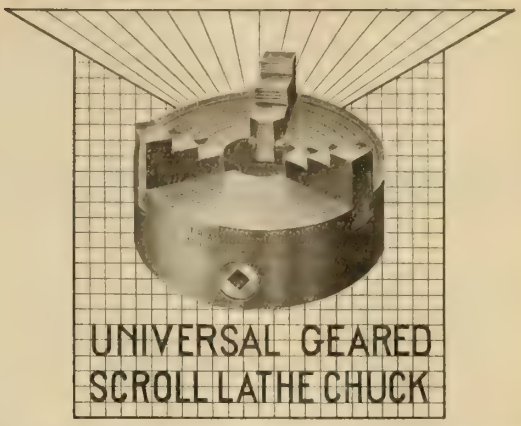
UNION MANUFACTURING COMPANY

New Britain, Conn.

New York Office: 26 Cortlandt Street

Makers of a complete line of chucks

ALMOND



The body is a one-piece casting which eliminates parts and chattering when under heavy cutting pressure. The jaws are made of special alloy steel and hardened through making them stronger than the usual case hardened jaws. Two styles jaws—No. 1 Common Jaws, No. 2 Rervers Jaws.

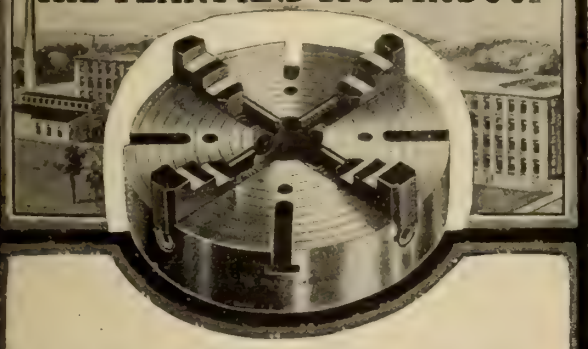
OTHER ALMOND PRODUCTS

Drill Chucks, Right Angle Transmission Micrometer Calipers, Flexible Steel Tubing.

T. R. ALMOND Mfg., Co.

Ashburnam, Mass.

THE PLANT AND ITS PRODUCT



SKINNER CHUCKS

Whether the work requires a powerful chuck with accurately adjusted, easily operated, effective jaws that grip and hold large work—or a small chuck for delicate and unusually precise work—there's a chuck in the Skinner Line that will best meet the requirements.

Our illustrated literature will interest you--
Shall we send it?

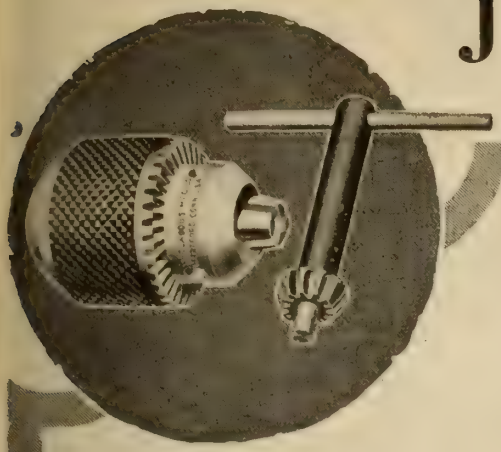
JACOBS CHUCKS



Jacobs Improved Drill Chucks do their part. They never disappoint the mechanic—no drill breakage —no lost motion.

Equip all your machines with them.

Address Department C.M.

THE JACOBS MFG. CO. HARTFORD, CONNECTICUT, U.S.A.

H & G

Die Head Cuts
Perfect Threads

The H. & G. Die Head illustrated is only 3⅝" outside diameter, yet it will cut from the smallest up to 1" standard thread and up to 1⅛" fine threads. For absolute proof of its ability to stand up and give good results, see the perfect threads it cuts on nickel steel. You can see these many places, but in almost any automobile or areoplane plant for certainty.

Made in 9/16", 1", 1½" and 2" sizes.

No stronger, more durable, more accurate Die Head was ever made.

New Haven - Conn.

THE BICKNELL-THOMAS TAPPING ATTACHMENT

Fits Any Make Drill

A friction mechanism inside the body of the attachment is automatically adjusted by the driving pressure, creating a very sensitive drive and eliminating the sudden strain of the reverse—responsible for many broken taps. This attachment is fitted with a plain chuck with jaws that grip both the round and square end of the tap shank.

Made to take taps from 3-32" to 1-4" in diameter.

BUTTERFIELD

BUTTERFIELD

The name "Butterfield" is your guarantee of the best workmanship, the highest grade material and the longest, hardest service under the most severe conditions.

To appreciate the quality of "Butterfield" Tools is to try them on your own work.

If you are looking for tools that are designed for accuracy and durability, that keep their cutting properties to the last—just stop at "Butterfield."

Write us for full particulars and price list.

Tools That Retain Their Keen Edges After Long Usage

SERVICE

and "THE COVENTRY" Chains are synonymous terms. This is attained by correct design, the use of special analysis steel, first-class workmanship and a rigid system of examination.

These, combined with a determination to produce only the best, give that steady, continuous service which is an essential feature of "THE COVENTRY" Chains.

The same service is at your disposal. If you wish to instal the most efficient form of Power Transmission, our Technical Staff will gladly give you all the assistance needed, without obligation, and without prejudice to any particular form of drive.

HENDEY

Improved Centering Machine

Hendey centering machine on centering work iu plant of Can. General Electric Co. on all sorts of portions of their product.

ASSURES perfect results at low cost. The distribution of metal insures the maximum strength with the least weight of machine; in this manner we have conserved on material and hence on machine cost.

Here are a few of the **Hendey** Improved Centering Machine features:—

The head is rigidly clamped to the bed, giving permanent alignment of spindle. Spindle is large in diameter with ample bearings, having felt oilers. Front journal is made taper, after the well-known pattern of our lathe and milling machine spindles.

Jaws of vise and supporting block are made of steel, hardened and ground. Jaws are aligned from spindle by proof bar carried in spindle. This care in alignment is exercised in order to enable machine to accurately centre stock for finishing purposes after coming from turret lathe or screw machine.

Parallel movement of vise and block is maintained by means of the connecting rod and bevel geared drive at back of machine, controlled from handle at front of vise. No matter what the diameter of bar may be, it will always be supported in a horizontal position. Saddles are gibbed and fitted to bed, and provided with binding handles for ready clamping in position.

Capacity of machine is from 5-16 to 4 inches inclusive.

Let us send our circular

"Superior" Grinding Wheels

Fast and Cool Cutting

Durable and Uniform

Vitrified Silica or Semi-Vitrified and Elastic process.

Shapes: Dish or saucer wheels, cups and cylinders. Also special shapes for drill and tool grinders. All sizes, grits and grades, 3/8 in. diameter and up.

It is most important that the proper shape and quality of grinding wheel is used for every job.

"FOSS" Service gives special attention to using the right wheel in the right place. We have a large stock of shapes and qualities on hand for prompt shipment.

Tell us your needs and you'll get the wheel that will serve you best.

PLANERS

SIZES 24" 30" 36" 42" and 48"

Any Length of Bed. Various Drives by Belt or Motor
Number and Arrangement of Heads as Desired

Our planers are built to combine solidity and accuracy with convenience and speed of operation. An unstinted and intelligent use of metal gives the machine an absolute rigidity under heaviest cuts, while the operating mechanism and adjustments are as simple, effective and convenient as possible.

Agents for Europe, CLEVELAND TWIST DRILL CO. (GREAT BRITAIN), Ltd., 36-37 Upper Thames St., London E.C.4.

You can't help noticing the good qualities of Pratt & Whitney Taps

Their free cutting qualities, their extreme accuracy and their extraordinary ability to outlive others distinguish them.

The con-eccentric relief—a distinctive P & W feature—is the secret of their goodness. One-third of the cutting edge is concentric. The remaining two-thirds has eccentric relief. Taps can be sharpened at the only correct point—on the face of the cutting edge. Sharpening in no way affects their size.

Yes, they cost a little more than some others, but they're well worth the difference. Carried in stock as are all other P & W Small Tools at our sales offices and agencies as listed.

MILWAUKEE MILLING MACHINES

Double Overarm maintains alignment.

It is impossible for the operator to place the arbor supports on the arbor and double overarm in any other way than in line. Arbor cannot be pounded out of line when using large, coarse pitch cutters on rough, heavy work.

Other Distinctive Milwaukee Features:

Solid top knee—hardened steel gearing and shafts in the column and feed box—automatic flooded lubrication — one and one-half gallons of oil per minute pouring over all gears and bearings in the column and feed box, insuring lubrication at all times—flanged spindle with hardened steel collar for driving arbors—constant speed drive, reverse being self-contained.

Send for our No. 21 Catalogue. Illustrating and describing Milwaukee Milling Machines and accessories in detail

ANNOUNCEMENT

THE ALGOMA STEEL CORPORATION, LIMITED, take pleasure in announcing to their customers and the Canadian trade that in accordance with the widespread desire throughout the Dominion that there should be obtained in Canada with Canadian labor, a much larger proportion of the requirements of this country in STEEL SECTIONS for STRUCTURAL PURPOSES, CAR CONSTRUCTION, SHIPBUILDERS' REQUIREMENTS, etc., they are just completing extensive alterations and additions to their rolling mills, and on or about 1ST NOVEMBER, will be ready to produce and ship American Standard Sections of BEAMS and CHANNELS up to and including 15", all standard sections of ANGLES from 6" x 6" down to 1¼" x 1¼", ZEE BARS for car builders and general purposes, small and large ROUNDS and SQUARES, and FLAT BARS up to 14" wide. The quality of the product is already well known to the trade, and is exclusively steel made by the Open Hearth process. and can be furnished in all grades from the softest rivet stock to high carbon special spring material.

MARK OF ALGOMA O.H. QUALITY

The following are the sections which will be rolled:---

ANGLES—Equal Leg—
6 x 6"—5 x 5"—4 x 4"
3½ x 3½"—3 x 3"
2½ x 2½"—2¼ x 2¼"
2 x 2"—1¾ x 1¾"
1½ x 1½"—1¼ x 1¼"

ANGLES—Unequal Leg—
6 x 4"—6 x 3½"—5 x 4"
5 x 3½"—5 x 3"—4½ x 3"
4 x 3½"—4 x 3"—3½ x 3"
3½ x 2½"—3 x 2½"—3 x 2"
2½ x 2"

BEAMS—
15", 12", 10", 8", 6", 5", 4", 3".

CHANNELS—
15", 13", 12", 10", 8", 6", 5", 4", 3".

ZEES—
3¼ x 5 x 3¼ x 5/16
3 5/16 x 5 1/16 x 3 5/16 x ⅜"
3⅜ x 5⅛ x 3⅜ x 7/16"
3 1/16 x 4 x 3 1/16 x ¼"
3⅛ x 4 1/16 x 3⅛ x 5/16"
3 3/16 x 4⅛ x 3 3/16 x ⅜"
2 11/16 x 3 x 2 11/16 x ¼"
2¾ x 3 1/16 x 2¾ x 5/16"

ROUNDS—
All sizes from ½" up to and including 4".

SQUARES—
All sizes from ½" up to and including 3".

FLATS—
All sizes from 1 x ¼" up to and including 14" wide.

MINE RAILS—
All sections from 12 lbs. up to and including 45 lbs. per yard.

PIG IRON—
Machine cast FOUNDRY MALLEABLE and BASIC.

SULPHATE OF AMMONIA.
NITRE CAKE.

For the better convenience of customers who may find it necessary to secure rush shipments of particular items, they contemplate keeping a large stock of all the various standard sections constantly on hand, and to this end extensive warehouse facilities are being prepared.
Your enquiries and business will be appreciated.

WILT

HIGH SPEED AND CARBON
TWIST DRILLS
REAMERS AND MILLING CUTTERS

Quality First

The Keystone Upon Which All WILT Products Are Built

A high standard of perfection is maintained throughout the various processes of manufacturing **WILT High Speed and Carbon Twist Drills, Reamers and Milling Cutters. WILT** products improve production! This is no theory, no untested statement, but an established fact backed by many of the largest manufacturers throughout Canada. For steady, reliable output of work that is satisfactory from the standpoint both of quantity and quality there is no better choice than **WILT Products.**

Put Them to the Test

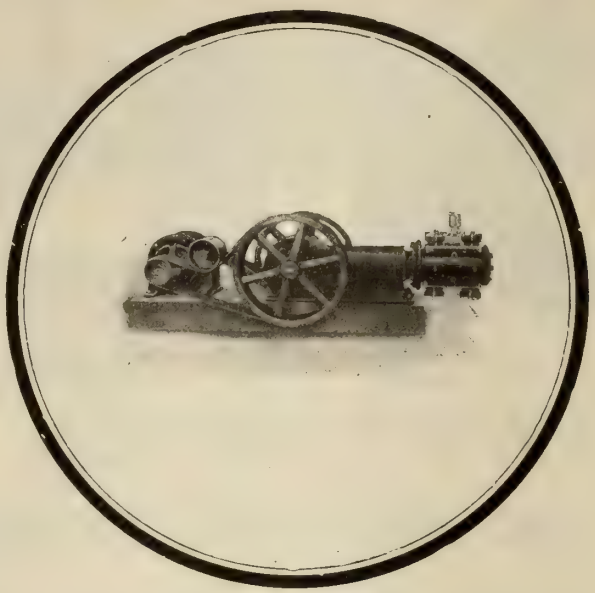
The Air Compressor for Cramped Quarters

The short-belt drive for air compressors is long past the experimental stage. It is the ideal drive for a compressor installed where space is at a premium. The total floor space occupied by motor and compressor is reduced to a minimum, the belt expense is cut down—running is smooth and quiet. In our own power house we have three two-stage compressors with this drive; we would not have installed them if the short-belt drive were not satisfactory.



All C-I-R-Co compressors are built to carefully determined standards of quality and design. Not only is all material subject to inspection, all shop operations have to secure the O.K. of the chief inspector; finally comes the running test which every compressor undergoes before shipment. The C-I-R-Co has been building air compressors for over twenty years and has a reputation to maintain. Our compressor bulletins will interest you.

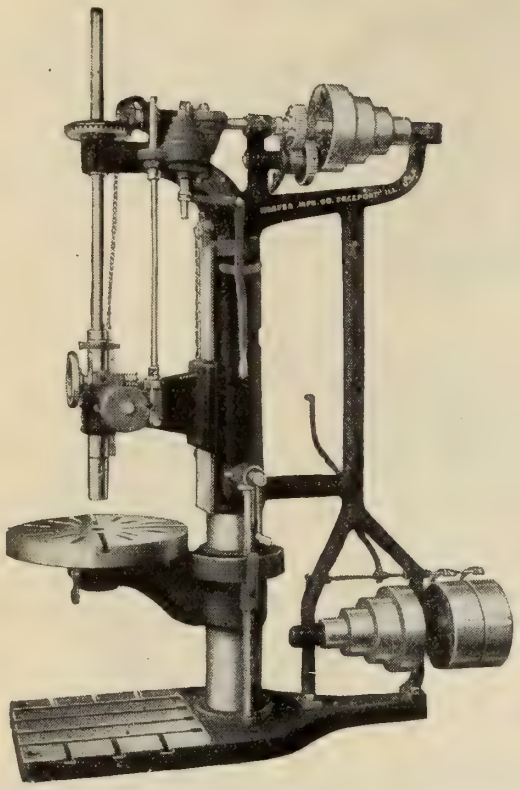
The Driller for Exact Work



HŒFER

Enable Your Workmen to Eliminate Spoilage

The Hoefer Driller is pre-eminently the one to be found in the best plants. "It's almost as good as a Hoefer," so often heard in the machine and tool trade, indicates the position held by Hoefer Drillers.

Exact drilling, to the last thousandth of an inch, pays by eliminating spoiled material. Hoefer Drillers pay for themselves and increase the workman's pride in his work.

Twenty-five Years on Market

Twenty-five years making drillers has given Hoefer the "Know-how." The Hoefer Drillers are used by many of America's leading manufacturers. Equip your factory the Hoefer way. Take any kind of a drilling problem you have to the Hoefer Manufacturing Company, and the Company's experts can tell you how it was solved by other men, some of whom you may know.

Investigate now. Write to-day for catalog. The Hoefer engineers are at your service.

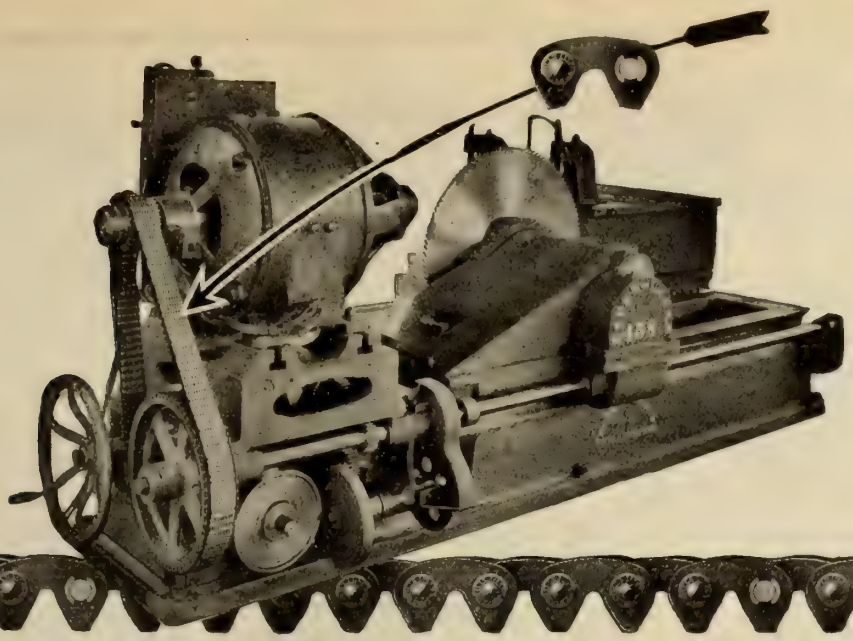
J. G. BLOUNT COMPANY
EVERETT, MASS., U.S.A.



98.2% Efficient
On Actual Test

This is what an actual test proved the efficiency of Link-Belt Silent Chain Drives

IT is one of the reasons why the Machine Tool Builders of this country are making it a standard means of transmitting power, and maintaining a higher standard of efficiency. Link-Belt Silent Chain Drives combine the flexibility of the leather belt with the positive action of cut gearing, eliminating the disadvantages of both and maintaining a higher efficiency than either. You need this drive for your new machine tool, for line shafting throughout your factory or any place where you must transmit power without slip or loss. Write for Data Book No. 125.

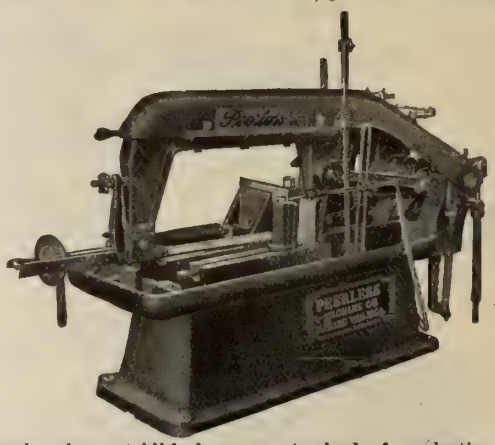
Peerless HIGH SPEED

Machines do 50 to 100% more work



The Peerless has established a new standard of production in so many plants that we are ready to ship one at our expense and risk, if you agree to give it a thorough test. A trial like this often results in our selling from 1 to 10 machines.

The Balance Lift of the Peerless

automatically raises the blade for the return stroke. This greatly prolongs the life of the blades, economizes power, and increases production. There are more good features which we shall be glad to acquaint you with.

The Peerless assures you the peak of production at very lowest cost. Write for full details.

PEERLESS MACHINE CO.

1607 RACINE STREET RACINE, WISCONSIN

If what you need is not advertised, consult our Buyers' Directory and write advertisers listed under proper heading.

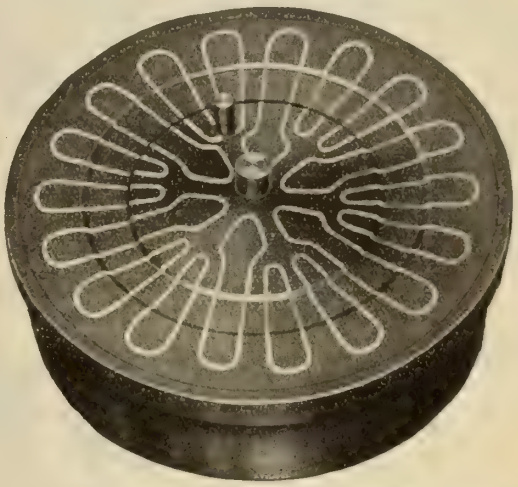
How Would You Hold This Piece?

Heald says "*Magnetically*"

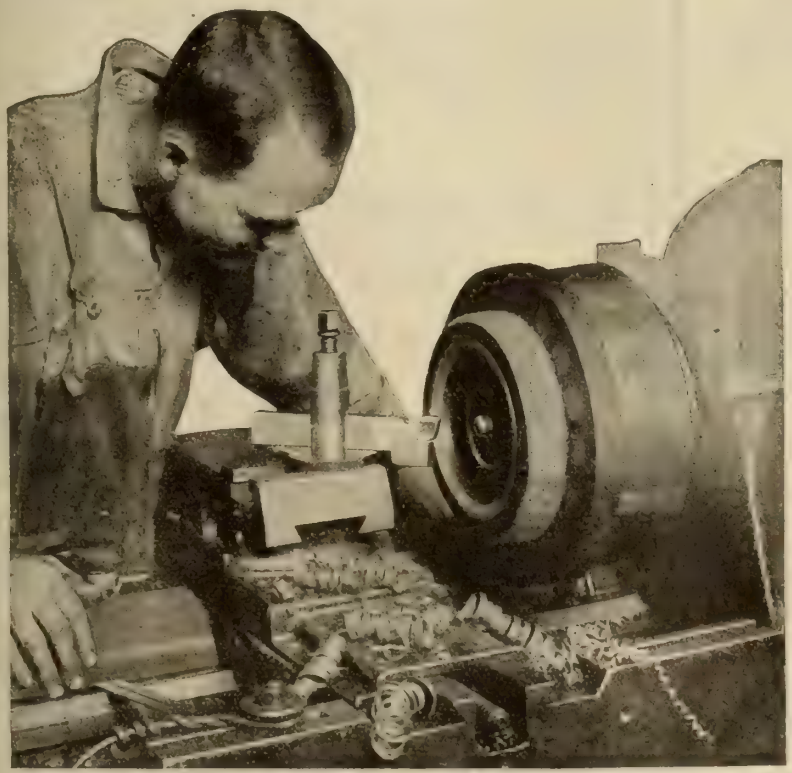
A most unique application of a Heald chuck was recently tried out on a lathe for holding a fabroil gear, to be turned inside and outside. The gear was centered by a plug in the chuck. Another pin, which entered a hole in the web, took the thrust of the tool and helped drive the work. The top plate of the chuck was grooved to fit the flanges of the gear.

Previously great difficulty had been experienced in centering the blank when holding by the outside diameter, due to the fact that the material consisting of cotton, extended beyond the edge of the flanges gave very uneven bearing.

The chucking time was reduced 20% and it proved so successful that eight chucks were ordered on its merits.



Chuck as arranged with centering plug and driving pin



Not every lathe job can be handled with a magnetic chuck, but a large majority can, especially where it is not necessary to take an extremely heavy cut.

Any machine dealer will furnish you a Heald Chuck.

JOHANSSON Gage Service covers Industrial United States and Canada. Our traveling representatives circulate through the territory shown on the above map, and make every effort to visit *each* shop *several* times during the year.

These men are not mere salesmen, calling upon purchasing departments. They are gage experts, each man with a fund of gage information that makes him welcome wherever he announces himself.

They study, think and talk gaging problems by day and dream of gages by night.

If there is such a thing in the world as a walking storehouse of gage-information the Johansson man covering your territory is it.

Superintendents, tool designers, tool makers, production men, inspectors — all enjoy a little exchange of gage-talk with our men. They learn something from the Johansson man, and the Johansson man learns something from them.

Nobody has to be on his guard against "salesmanship" when he sees a Johansson representative.

With our men it is *gage service* first and last—with *gage sales* only when everybody is willing.

So, next time the Johansson man sends in his card, see him, let him go through the "works" with you. He might see something that would permit him to offer a suggestion worth much to your department.

Remember—it is well to be acquainted with anyone who can be of service.

Mailing this coupon will signify your willingness to become acquainted.

MATTHEWS OF PITTSBURGH

Durably Made Steel Letters and Figures

For Marking on all Kinds of Metal

MATTHEWS Steel Letters and Figures are handmade from high quality Pittsburgh steel, properly tempered to assure hardness. They give long service under hard conditions.

Matthews line of steel stamps includes a wide range of letters, figures and symbols—for concave, convex or flat surfaces.

Do Not Shroud Business in Too Much Secrecy

Sane Influences Must be Set at Work to Combat the Revolutionary Doctrines That Are Being Spread in This Country—Production the Proper Basis for Payment

MORE and more large employers of labor are discussing in a public way their problems. It used to be considered that matters of policy, of employment and management were closed books as far as any but a few on the inside were concerned.

The time has arrived when those in positions of responsibility must speak out. They cannot afford to stand pat and let the agitators go ahead and do their worst.

It is high time that leaders in our industrial world were putting in their rebuttal evidence. The man who hears only one side of the story, who is told times without number that he is being robbed and plundered by his employer, who hears whisperings that he earns his wages in two or three hours every day—he should be brought face to face seriously with real facts. Let him hear that there are responsibilities as well as privileges in operating industry, and that those who would shirk the former have no right to claim the latter.

Mr. Charles Piez, president of the Link-Belt Company, of Chicago, a firm that has a pay-roll of over 2,200 men, recently spoke to a gathering of the Associated Business Papers, and in his address said:—

I believe in, and always have believed in the technical and trade papers, declared Mr. Piez. I believe that they have exerted and are exerting a very powerful and beneficial influence in advancing industry, and I believe they have a larger mission still ahead of them, a mission that will call for every bit of energy and intelligence that you gentlemen are capable of.

I am glad, too, that you have joined together for the purpose of furthering your common aims. My interest in the technical and trade press has not been of an indefinite or abstract character. It has been direct and concrete, for, in spite of many arguments from my own men, and much pressure from the outside, I have continued to believe that the technical and trade press is the most direct and the least diluted and the most satisfactory medium of advertising our goods.

I believe you gentlemen have solved very well the problem of the technical development of the industries. You have been a big factor in making industry, American industry, what it is to-day. I am not going to confine myself to the title of the address that is put down, because I feel that what I ought to do to-day is to enlist your co-operation in a considerably broader field than you have heretofore occupied.

The Menace in the Labor World

IF there is any cloud on the horizon of American business, if there is any menace to the continued prosperity of American industry, it lies in the present day labor unrest. No matter where it has had its origin—the war has brought about some of it, the rising cost of living has brought about much of it, unfulfilled expectations have caused other parts of it—but the unrest is being capitalized to-day by a group who are not aiming at a mere improvement in the conditions and hours of labor, but who are aiming at the control of industry and the control of our great Government as well.

I don't know how many of you gentlemen are familiar with the propaganda that is going on, particularly through the foreign newspapers. There are some seven or eight hundred publications, all of them containing poisoned articles against the fairness of the distribution of the profits of industry, against the fairness of our system of government. There are something like 2,500 paid lecturers, drawn from foreign-born and native intellectuals, who put up a continuous story of the wrongs of the present wage system and the present social regime. Perhaps the biggest cause of unrest, and I have met this not only in my own business repeatedly, but also in my experience with the Fleet Corporation, is the exaggerated notion which the men have of the profits of industry.

How One Strike Was Stopped in the Bud

SOME six years ago we were threatened with a strike at our Indianapolis plant. We have there something like 2,200 men. The superintendent called me up and asked me if I wouldn't come down and address the men. I have been in the habit of getting all our workmen together and talking to them collectively for many years. I have found this to be highly effective. I hurried to Indianapolis and found when I got there that the strike was threatened not by any conditions inside of our plant, but because of some grudge against another plant in the city, with which we had nothing to do, and over which we had no control. The strike involved the machinists and tool-makers, two of the very vital crafts in our industry.

We called them together and I gave them a talk. After I got through, I asked them whether they had any questions to ask, and told them I would be very glad to answer any they might raise. One man who had been with us many years, a very able tool-maker, said, "Mr. Piez, don't we earn our day's pay in two hours' work?" And I said, "Well, now, let's examine that. How many hours a day do you work? Nine a day, don't you?" He said, "Yes."

"What do you get?"

"Sixty cents an hour."

"Then your proposition is, that you earn $5.40 in two hours' work, for which we pay you $1.20."

He said, "Yes, that is right."

I said, "That means that we are making a profit of $4.20 a day out of your labor. Four dollars and twenty cents for two hours, or $2.10 per hour profit out of your

labor. That is three and one-half times your hourly rate, and if we carried this same argument through, our profits must be equal to something like three and one-half times our total pay-roll."

I got a blackboard and went through the figures, demonstrated that if his conception of his earnings and the value of his earnings and our profits, was right, the profits of the concern would have to be something like three and one-half times our pay-roll.

This happened in March, soon after our annual meeting. I sent for our annual report, and then demonstrated that our profits for that particular man were less than a dollar per man per day, about 25% of the pay-roll instead of 350% of the pay-roll, and the expression of that man, which I can't repeat because it had some profane emphasis in it, was that he never knew our profit was so small.

Making the Most Absurd Claims

THE radical preachings in the foreign press constantly emphasize the fact that between 80 and 90% of the earnings of the individual go to the master as profit.

In the Seattle strike—and I dwelt upon that incident in a talk last week—the feeling was that the earnings of the owners were 90% of the total earnings of the man. The company got $60.00, out of which they paid him $6.00. Yet a very simple and quick calculation showed the absolute fallacy of that; showed that the profits computed on that conception were between four and five times the value of the annual output.

Now, that statement was repeated to me at a conference held in Washington where there were 120 representatives of labor of the Western Coast. I am giving emphasis to it at the present time because I believe that, after all, the fact that the sane-minded American workmen, intelligent workmen, have the idea that they are being treated unfairly and are receiving too small a share of the profit, lies at the very bottom of the general unrest.

I have no fear that they are going to lead the American workmen into the camp of Bolshevism, but I do fear they are going to change their perspective, because these statements are insidiously made and never refuted.

Don't Use the Shroud of Secrecy

THE manufacturers shroud their business in too much secrecy. They don't talk it over with their men. I would feel like a thief if I felt that part of the earnings of our company were filched from the men by withholding from them a just part of the earnings they have made. And on that account I am prepared at any time to discuss it with them, to be converted to their side, or convert them to mine if that is possible. I don't believe that it is wise for the industries and the employers generally to permit a misconception like that to stay unrefuted, because it is so easy to prove it to be wrong.

Now, it struck me—and I have tried to solve the question of unrest in our own industry, and I am talking to you gentlemen because I think you can be factors in settling this unrest—I have thought that the best way to reach our men, because they have grown so in numbers I can no longer reach them personally, is to reach them through our superintendents, our foremen and sub-foremen. I find that mose of these men are intelligent, active, alert Americans, typically good citizens, upon whose judgment we rely to create sound public opinion, and they must be the judges of the correctness of our theories and our methods and serve as our champions.

Pays Wages on Production Basis

I APPRECIATE the remarks you gentlemen have made concerning partnership with business. I want partnership with our men, but recognize there are many ways of securing it. Partnership must be based on fairness, and must involve acceptance of risk, as well as participation in profit. It must, therefore, be confined, in many cases in industry, to the immediate work which is under the control of the partner, and he must not be held responsible for the failure or success of policies or theories with which he had nothing to do. You can't make a partner of the man who is not responsible for the risk the partnership involves, and you can't expect a workman to sacrifice a part of his income in such a partnership. You must, therefore, confine his interest to the work under his control, and give him part of the profits which extra effort or intelligence on his part brings about.

My company has been paying on a production basis for many years, and we have had no labor troubles. We try to keep step with the conditions, but we always adhere to the policy of paying on the basis of production. It is the only fair way; it is the way every man in business, from the top down, ought to be paid.

During the war the principle was laid down that the rising cost of living should be taken account of in the payment of wages, and while this was perhaps sound doctrine several years ago, when coupled with the other restrictions with which it was surrounded, it is now pretty generally held by our labor friends that the cost of living should be the sole basis of wages, production being entirely omitted. If the cost of living is to be the basis of wages, why apply it to any particular group of workmen? Why not apply it to all? Why not determine the per cent. of advance at certain specified times, and then by fiat of the executive, raise all wages and salaries simultaneously, by the per cent. of increase? That would soon show the absurdity of the principle, for you cannot take more out of the pot than you put in it.

Gentlemen, the demands that some of the radicals are making cannot be satisfied with increased wages, for they demand nothing less than turning industry over to them. There is no justification for that kind of partnership, for the only kind that is successful in business is that which is earned and paid for.

I have bought Link-Belt stock ever since I came with the company, and I have acquired what interest I have because I sacrificed a very considerable part of a very meagre income for many years in order to buy it and hold on to it. There are 180 of our employees among our stockholders to-day, because they helped us conduct the business and helped us develop it. For years we have insisted that the older interests as they retire, surrender part of their stock for distribution and sale to the younger men. That is my idea of a partnership. It has worked well in our case and in many other plants. It is a very sound policy.

It occurred to me that you gentlemen might help very much in stilling the present day unrest. I think after all it is but a phase of after-war conditions—but a result of a transition from war to peace. It is of temporary duration, but it has to be handled well. What we have to do is to bring back the proper perspective of our men, and not let them go off on a tangent.

Now, the radicals reach the men, not after hours, but during hours. They reach them by planting in your works men who have been especially coached for the job. We had some planted in the 39th Street plant not more than nine or ten months ago. Those men talk to the other men when the foreman isn't looking, and pour into them radical ideas about the wage scale and shop conditions, and when they find a man who has a pet grievance they fill him full of the seeds of distrust. And they plant men successively who develop and spread this distrust. That is their game. Our method of meeting it is through the foreman.

The foreman isn't a good foreman unless he has the respect and confidence of the men. They must respect his ability as a mechanic, his character as a man. It is the foreman and the sub-foreman whom we ought to coach up and prepare to meet this insidious doctrine that is being spread to the detriment of the industry.

What Do We Know Regarding Hydraulics?

The Subject of Hydraulics From Both a Theoretical and Practical Standpoint is Described, Particular Stress Being Laid on the Application of This Knowledge to Fire Service

By DONALD A. HAMPSON, Associate Member A.S.M.E.

MOST men can trace their interest in the active work of fire departments back to boyhood days and the delirious joy of going to a fire with all the thrilling and noisy accompaniment. Men in the mechanical field are naturally interested in modern apparatus, its performances, and advances in the protection of life and property. In smaller cities with their volunteer fire departments and in private plants which maintain some sort of a department or other means of protection of their own, the engineering features such as the selection of new apparatus, repairs, hydraulic problems, etc., demand the assistance of someone with special training—and that someone is usually selected because of machine shop, engine room, drafting or surveying experience. With a good working knowledge of hydraulics to guide them,

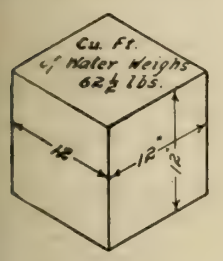

FIG. 1.

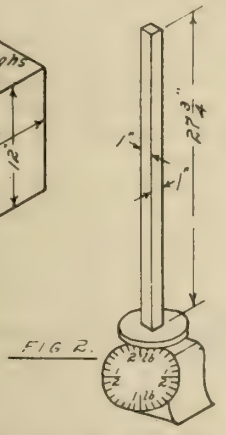

FIG 2.

FIG. 1—ILLUSTRATING THE WEIGHT OF WATER.

FIG. 2—SHOWING COLUMN OF WATER THAT GIVES 1 LB. PRESSURE PER SQUARE INCH.

men of the machine trades are particularly well fitted to assist in this work—often at the same time gaining an unusual opportunity to appear in public life, where their business habits of getting quick, definite results in an economical manner make a unique showing alongside of the average municipal proceedings.

The Water Supply

Back of the fire department there must be a water supply. Viewed from several angles, the supply is of vital importance to all residents of a community. Except in new communities, a means of water supply has been provided, it serving for domestic, fire, and industrial uses. Many plants have their own water supply, either to assure better and quicker results in conjunction with city service or, in the case of isolated plants, to provide the only means of fire protection that is available. Whether public or private, an adequate or a seemingly too adequate supply is a measure of economy, figured in terms of insurance premiums, if in no other. Incidentally, it may be stated that the fire loss of the world in times of peace is approximately two hundred and fifty million dollars per year!

There are three common sources of water supply, i.e., the gravity system which delivers water from a reservoir on a higher elevation; standpipes which furnish a substitute for the higher elevation and into which the water must be pumped, and some arrangement of cisterns or wells from which the water is pumped into the mains. This latter system is in very limited use—the constant expense of pumping and the restricted quantity of water available making such a system of value only in special cases, though for industrial fire purposes where a positive source of power is to be had, pumps are recommended.

Villages that are not in a position to instal a gravity system, either from geographical or financial reasons, find the standpipe admirably adapted to their needs; pumps of some sort are required to keep the supply full, but it is often possible to arrange the installation in connection with some other work, thereby decreasing the maintenance expense. Standpipes are tanks, generally of metal, set upon a solid foundation on the highest elevation near at hand. Before the general introduction of elevated tanks, standpipes were often used for factory protection.

But the most widely adopted and satisfactory water supply is the reservoir, fed by rainfall alone or in conjunction with springs and streams. Its location is selected from a number of possible sites in which elevation, watershed, distance from the community it is to serve, cost of reservoir and pipe lines, and further expansion of the system are the factors weighed in making the selection. Maintenance is but a small item if the work is well done in the beginning, and it might be added that such a water system will not only pay dividends, but it will have the distinction of being the one self-supporting department in the community. A well-laid-out system will provide an abundance of water at all times, and this at a pressure that is not so high as to cause serious leaks in the piping and yet is ample for all needs.

The Part of Gravity

Gravity plays the leading part in the great drama of water. The reservoir, or gravity system depends upon this phenomenon for its action. Nearly all hydraulic calculations contain the factor of gravity or one that is deduced from it or is a substitution. The force with which the stream of water issues from the faucet is due to gravity and is the same in amount as if the water had fallen from directly overhead the same height instead of having come through long lines of pipe—there is, however, some loss in coming through pipes and around bends.

Hydraulic measurements are not made by weight but by pressure, though as just stated the weight (gravity) is the basis of pressure. In Fig. 1 we see the familiar cubic foot of water that weighs 62½ lbs. Weights of all other substances are taken from this as unity—steel, for instance, having a "specific gravity" of about 8 and weighing about 500 lbs. for a cubic foot. If we could shape water into a rod 1 in. square and have that rod 27¾ in. high, its weight upon the scales, Fig. 2, would be 1 lb.; this is an important point—it should be memorized because the length ex-

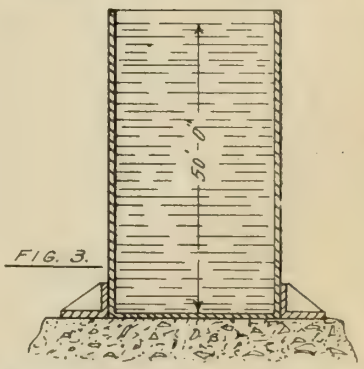

FIG. 3.

FIG. 3—TYPICAL STAND PIPE. THIS DEPTH OF WATER PRODUCES A WEIGHT AND PRESSURE OF 22 LBS. ON EVERY SQUARE INCH OF THE BOTTOM.

pressed as 2.3 feet is a frequently used factor in conversion. Our standpipe, Fig. 3, has 50 ft. of water in it—therefore the pressure on the bottom is 50 ÷ 2.3—22 lbs. per sq. in.

That water has weight every fireman can testify, but he seldom knows how much weight. A length of filled hose is heavier than most persons would guess; a one foot section of 2½ in. hose weighs 1½ lbs., and the water it holds, 2 lbs., making a total of 3½ lbs. as seen at Fig. 6—this is 175 lbs. for a 50 ft. length of hose without fittings! Water can be compressed but a fraction of one per cent. This property makes it invaluable in hydraulic machinery where thousands of tons pressure must be maintained. Water pressure is distributed equally in all directions as may be seen by reference to Fig. 4, where the piston in the left hand cylinder compresses the water, distributing the pres-

sure equally in all directions against the walls, as contrasted to the right hand piston which bears on a block of wood which transmits the same pressure directly and solely to the bottom.

The vertical height determines the pressure at the point of issuance. This height is called the "pressure head" or just "head"—it does not matter whether the points are directly over one another or miles distant, the vertical height

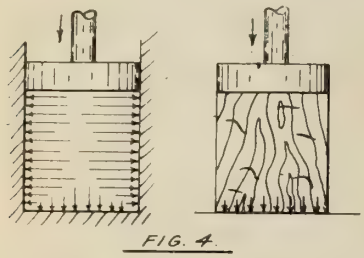

FIG. 4—AT LEFT WE SEE THAT WATER PRESSURE IS TRANSMITTED EQUALLY IN ALL DIRECTIONS. AT RIGHT WE NOTE THAT PRESSURE ON A BLOCK OF WOOD OR METAL IS NOT EQUAL.

remaining the same, the outlet pressure will remain the same, barring certain losses in the flow. Fig. 5 illustrates this point by an actual case from one city. Two hydrants were selected, one but an eighth of a mile from the reservoir and the other two miles away, but both having the same elevation, i.e., 150 feet below the surface of the water. Both hydrants are on the same 24 in. main, and according to the law of "head," both should show the same pressure, which they did without about one per cent.

Filters as a part of the municipal water system cut off some of the pressure—that because they are situated below the level of the reservoirs about ten to twenty feet and the water going into the mains partakes of a head based on the elevation of the filters. This means a loss of five to ten pounds pressure in the mains which may cut down the effective pressure for fire or high sections served so that pressure filters have to be installed, these being filters which have the pressure put back (so to speak) by pumps.

Besides weight and pressure, the factors of friction, velocity, and discharge figure largely in hydraulics. It is often said that water seeks its own level and rough calculations (?) are made upon such action. Water does seek its level but it never reaches it in any but a closed system, i.e., one where there are no discharges and where the water has time to adjust itself—the level is not reached until motion has ceased. The factors mentioned at the beginning of this paragraph are responsible for failure to reach the level in an open system.

The Hydraulic Grade Line

The height to which water will rise in a flowing system is shown by what is called the "hydraulic grade line," an imaginary line drawn from the surface of the supply to the last point of discharge; if at any point along the main, a tube were erected, the water would rise to that line—also if any part of the main rises above the line or some part of the city is above it, water will not flow there unless pumped or siphoned. Knowledge of the principle of the hydraulic grade line is of interest to firemen in noting the greater pressure at some locations than others. Fig. 7 shows an easily constructed model to illustrate and prove the principle; it will be seen that the water rises to the line; but if the outlets were plugged, the water from the tubes would spurt as high as the level in the tank.

The fireman must take the water at the hydrant as it is. The path from the main to the nozzle is usually shown as by Fig. 8, and the relative areas and capacities as shown at Fig. 9. The 4 in. pipe leading into the hydrant looks much too large for the 1 in. nozzle which the fireman uses—and it would be if the rate of flow were the same in each, which it is not, a nozzle being a device to increase the speed of delivery and thus needing a large feed pipe.

The fireman works with movable equipment—pumps, hose, and nozzles. Special formulae have been worked out for use in this connection because the standard formulae of hydraulics do not fit these special conditions. In big pipes, water flows along easily—the water in the 24 in. main at Fig. 5 loses but 1 lb. pressure in two miles of travel and it discharges over 16,000 gals. per min. (constrast this with a 3 in. pipe laid over the same stretch which would discharge only 20 gals. per min. to see the efficiency of large pipes). A familiar formula for discharge is:

$$\text{Gals. per min.} = \sqrt{\frac{D^5 \times H}{L}}$$

D in inches, H in feet, and L in yards.

Water is restricted in its flow by a number of factors such as—the resistance it offers to entering the pipe at the reservoir, friction in running through the pipe due to rough interior and confinement, bends in the pipe, branches leading off, and changes in the size of the pipe.

Friction

Friction is the big item of loss both in pipes and hose. Iron pipes are subject to a disease called tuberculation, a raising up of lumps on the interior, hastened and aggravated by an imperfect protecting coating at the time of manufacture. Tuberculation not only decreases the effective area but it makes this roughness which is the cause of so much friction. There is friction of liquids just as there is friction of solids and just as a weight is more easily shoved over a glass surface than an unplaned board, so water moves more easily through smooth vessels.

Fire hose is lined with rubber to make the interior smooth, as well as to make it waterproof. The friction of water moving inside good rubber lined hose is fully one-third less than through iron pipe of the same inside diameter. But when the lining gets worn, the friction may rise 50 per cent., showing that to get the required discharge worn hose must be replaced. This friction on the interior has been termed "skin friction."

The usual way of stating friction is to speak of it as so much loss of pressure in lbs. per sq. in. or as the pressure lost in 100 ft. of hose or pipe. In passing through a hydrant there is a loss of pressure of from 2 to 3 lbs.; and in connection with this it might be added that that is less than the friction loss in a hundred feet of good hose carrying only 150 gals. per min., showing that it is false economy to space hydrants too far apart.

Friction varies:

(1) Increases directly with an increase in length of pipe or hose.

(2) Increases directly as the inside diameter gets smaller.

(3) Increases as the square of the velocity.

(4) Increases with the flow.

Rule 4 is not commonly stated because it follows from rule 3, but it has been added here to emphasize the point, for firemen are apt to expect greater discharge than is actually realized by trying to increase velocity. As velocity is simply rate of speed, naturally more water will pass through with increased velocity, but a proportionate increase is retarded because the friction increases so rapidly. Table 1 gives the friction loss in 2½ in. hose for several rates of flow; considering eight or ten lengths of hose with a given flow and with twice that flow, we see that very little pressure can survive by the time the water reaches the nozzle.

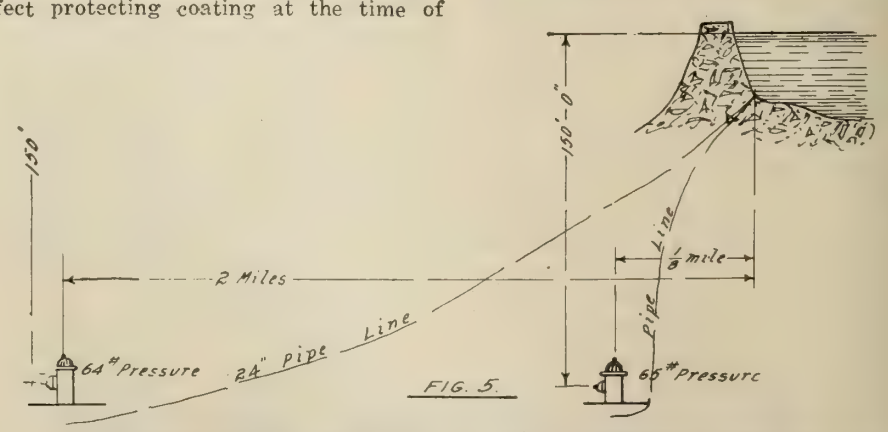

FIG. 5—ILLUSTRATING LAW THAT THE HEAD DETERMINES PRESSURE AND DISTANCE HAS VERY LITTLE EFFECT.

At the fire, the fireman has little time for hydraulic calculations. He is concerned with water where he wants, when he wants it, and with the most speed, and to attain his ends he must practise applied hydraulics, either knowingly or not. The Siamese is a device to get the same amount of water to a

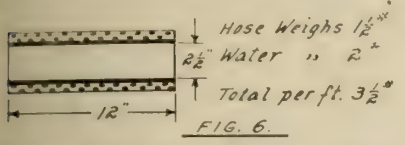

FIG. 6—SECTION OF FIRE HOSE AND ITS WORKING WEIGHT.

given point without such a great friction loss as obtains with a single line, that means more water because the velocity will not have been reduced to such a great extent. A study of the right hand column of table 1 shows at once the gain resulting from the Siamese—not to know the value of the Siamese may mean defeat at a big fire or when water is limited.

Returning now to the four rules of friction we find other chances for their practical application. Rule 1 shows why long hose lines should be avoided—thus, if there is a loss of 5 lbs. pressure in one length of hose, there will be a loss of 50 lbs. in ten lengths, which may absorb the entire pressure from the hydrant. Long lines of hose have no excuse for their existence, in most cases, except to furnish work for firemen.

Rule 2 does not affect the fireman because the size of hose and water mains have been fixed long before he arrives. Two and one-half inch hose has become standard except for the high pressure service in big cities, where 3 in. hose is used. For information it will be stated that the friction loss in 3 in. hose is less than half that in 2½ in. hose.

Rule 3 shows that if the water is forced through faster, the friction increases at an alarming rate. As previously stated in connection with flow, increasing the velocity is not always a good policy for a point is reached where the friction actually holds the water back and no gain is realized.

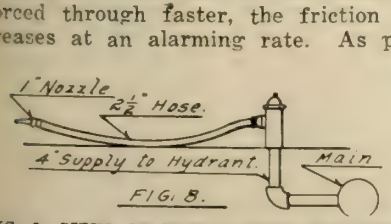

FIG. 8—SIZES OF USUAL FIRE EQUIPMENT.

Our knowledge of friction, then, tells us that more water is obtained for fire use—by keeping the lines short, by having only hose with smooth lining, and by limiting the velocity to, say, that corresponding to a nozzle pressure of 70 lbs.

Velocity

Velocity, as a rate of movement, may be expressed as feet per sec. for water, or in the case of a train, as miles per hour. There are two sources of velocity of the fire stream—"head" and pumps, which create an artificial head. Then we have nozzles which are a device to increase velocity.

Either by reason of the heat or of inaccessibility, it is seldom possible for a fireman to get within anywhere from ten to a hundred feet of the blaze—his stream of water must bridge this space and to do that effectively it must have some force to carry there. An effective fire stream is one that will pass through a ten inch circle at the point of consideration, that has not broken up into spray at that point. The effectiveness of a stream depends upon its velocity and its discharge. If a fireman pointed the open end of a length of hose toward a fire, the hose would discharge just as much water as if it had a nozzle attached, but the water would never reach the fire, it would fall but a few feet from the open butt. The reason for this and for the use of nozzles will be made clearer by a little elementary hydraulics.

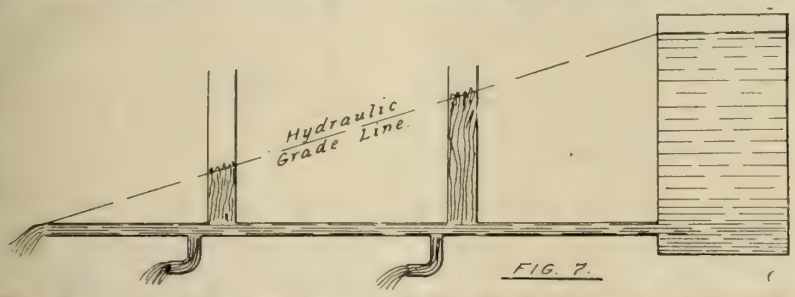

FIG. 7—MODEL USED BY AUTHOR TO SHOW THAT WATER DOES NOT RISE TO ITS LEVEL WHEN DISCHARGING. PIPES ERECTED AT ANY POINT WILL FILL ONLY TO HYDRAULIC GRADE LINE.

The common formula for a velocity is $V=\sqrt{2gh}$ where V is in ft. per sec. and h is the head in feet, while g is of course 32.16 (gravity). The principal use for this formula is in finding the velocity at a nozzle when the pressure is known, altering the formula to terms ob lbs. per sq. in., as $V=\sqrt{4.6gp}$. As an example a nozzle pressure of 70 lbs. gives a velocity of $\sqrt{4.6\times32\times70}=101$ ft. per sec., which is at the rate of 70 miles per hour. A 40 lb. nozzle pressure equals 51 miles per hour, showing that a fire stream travels at a high rate. The velocity from a pipe line is effected by conditions previously named, one formula for this being

$$2.3\sqrt{\frac{h\times d}{.02\times1}}$$

Based on this formula, the pipe line of Fig. 5 should show a theoretical velocity of 98 ft. per sec., but actual tests showed it to be only 86 ft. per sec. during the day time.

TABLE 1.

Nozzles convert volume into speed, just as the narrow ravine forces the brook to travel faster than when flowing through the wide meadow channel—the flow is practically the same in either case. The shape of the nozzle has much to do with keeping up the volume; thus in Fig. 10 if a hole is cut in the side of the standpipe as at A, the flow will be less than three-fourths what it would if a nozzle were applied as at B. The loss at A has been termed the "contracted vein." The velocity at the point of issuance is the same as it would be if the water had fallen a height equal to the head.

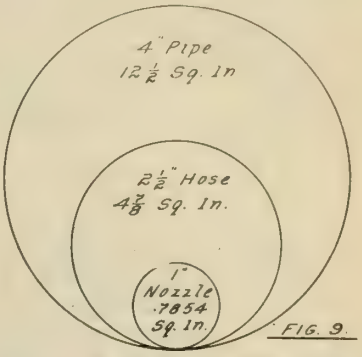

FIG. 9—ACTUAL SIZES, SHOWING ALSO RELATIVE CARRYING CAPACITY AT THE SAME VELOCITY.

As the velocity is the "get there" of the fire stream, anything that decreases it should be avoided as much as possible. Velocity is reduced by sharp bends, roughness inside the line, fittings, and changes in size. To what survives, we owe the activity of our fire streams. The range of a stream of water discharging horizontally is illustrated by Fig. 11, and calculated by the formula $R=\sqrt{4hy}$. In fire work, the streams are seldom horizontal and there is seldom any means of knowing the head, therefore, the range—or "reach"—as it is called is found from the pressure at the nozzle, and the latter determined by a gauge applied to the stream close to the point of issuance. Nozzle pressures and fire distances vary so much that tables have been prepared showing the maximum reach on an effective stream at many

NOZZLE PRESSURE.	20	25	30	40	45	50	55	60	65	70	80	90

TABLE 2.

different pressures, of which the Table 2 is an abbreviation. What are called "horizontal" and "vertical" distances in the table are shown by Fig. 12. The figures of Mr. John R. Freeman, determined nearly thirty years ago, have been the recognized standard for fire streams—he fastened his hose to heavy planks for his experiments and directed them at the angles of Fig. 12.

It will be noticed from the table that

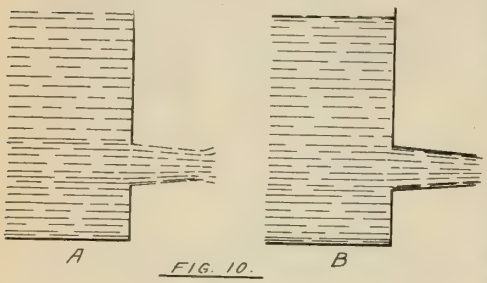

FIG. 10.

FIG. 10.

the increase in nozzle pressure is not accompanied by a proportionate increase in reach—this shows us the folly of trying to get more water, and that further, by increasing the pressure—somewhere around 50 lbs. at the nozzle is the most efficient stream. It will be also noticed that the vertical reach is greater than the horizontal. Table 2 is the reach with a 1 inch nozzle, the reach with other sizes up to 1½ inches do not vary 2 per cent. from this, showing that size of nozzle has nothing to do with reach.

Discharge

The discharge from a pipe is found from the formula to be Q=gals. per min.=.04d^2×vel. Greater velocity means greater discharge both from a pipe and a nozzle. To obtain the discharge from a nozzle when the pressure is known, the formula is D=29.7$d^2\sqrt{p}$. As an example a 1 inch nozzle at 60 lbs. gives 216 gals. per min. This formula is near enough for practical results, but differs from actual discharges calibrated and compiled into tables—the tables give 229 gals. for the conditions named in the last sentence—the use of co-efficients brings the computed discharge up to the tables, but as it is difficult to remember these for all conditions, D=30$d^2\sqrt{p}$ is sufficiently accurate for field work. Due to the contraction named and shown by Fig. 10, an opening of the sort at A or the flow from a hose end—open butt—is materially reduced from that if some form of nozzle is provided, the open butt showing a discharge of only 70 per cent.

It is often desirable to know the discharge, but the nozzle pressure is not known though the pressure at the hydrant or the pump is. The discharge through lines of hose depends upon their layout—long lines of hose, hose carried up ladders, and sharp bends cutting down the discharge very much; in such cases the pressure at the hydrant or at the pump, if one is being used, does not indicate the ratio of discharge—it indicates certain operating conditions which build up the pressure at that point. This pressure may be used to find the discharge by the use of a formula in which N.P. is the nozzle pressure, E.P. is the pump or hydrant pressure, L the number of 50 ft. lengths of hose, and K a constant from the table 3.

$$\text{Then N.P.} = \frac{\text{E.P.}}{1.1+KL}.$$

An example is 2 lines of 2½ inch hose Siamesed into a 1½ inch nozzle with the pump showing 140 lbs. The N.P. then will be

$$\frac{140}{1.1+135\times 2} = 104 \text{ lbs.}$$

Knowing the nozzle pressure and the size bore, the discharge can always be found by the formula previously given, for our example D=30×1½$^2\sqrt{104}$=681 gals. per min.

The constant K has to be selected according to the number and size of lines and the bore of the nozzle. Only values for 2½ inch hose have been given in this table. Sometimes the nozzle pressure is known and the hydrant pressure is not and it is desired to form an idea of the latter; in such a case the discharge formula is translated into E.P.=N.P.×1.1.+KL.

It takes pressure to get water through long lines of hose with their friction and up ladders with the loss of head and weight of water and through small nozzles converting to velocity. A few localities have sufficient pressure for any fire demands, but most cities do not and the water in the mains has from 20 lbs. to 60 lbs. pressure. Pumps of the stream or motor-driven variety must then be employed for fire departments and power pumps for industrials. Pumps increase pressure—they are usually capable of increasing it beyond what hose will stand for long.

As has been said, the gauge on a pumping engine is indicative of the work the machine is doing—not of the amount of water the firemen are getting. That should be firmly fixed in mind. Enthusiasm in volunteer departments turns often to getting a high pressure at the machine instead of water on the fire. A couple of good, effective streams on the fire are better than a dozen poor ones. The same enthusiasm frequently leads to the laying of so many lines that none delivers an effective stream. The writer has seen first-class pumpers virtually useless because placed where the supply had already been tapped by many hand lines of hose—the pumper could get but little water, and this it was distributing through long lines to fearless men who couldn't reach above the first flo Very likely the taxpayers of that co munity would be asked to enlarge t water supply, when the whole troub is lack of knowledge of hydraulics those in charge.

Lines which are carried up ladders through water towers or standpipes not discharge the amounts of the fo mulas given unless first the engine pre sure is decreased by an amount whi is the height of rise multiplied by .43 The gain in carrying a line up a ladd or in a building is that of obtaining better point for play of the stream-there is no gain of velocity or discharg

Where there is a pumper, it is of i terest to know its capacity as compare to the delivery of the main from t reservoir or as compared with so stream that may flow through the tow and which might be called upon to su ply water for a serious fire. Very fe streams of size that have not had the flow measured at some time or other-suppose that it was found to be 31,0 gallons per minute—that would equ the rated capacity of thirty-one pumpe of standard 1,000 gallon capacity;

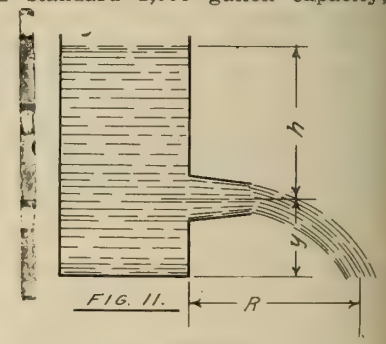

FIG. 11.

FIG. 11.

considering the main in Fig. 5, that wil deliver about 10,000 gallons per minute which equals the delivery of ten ma chines of the assumed capacity.

The selection of the best kind of pum is a matter of local conditions. A pum for stationary fire service may be of the gear type, centrifugal, or piston pump the triplex pump of the latter type be ing highly in favor with the under-writers. The matter of drive for the pump has much to do with the type selected; for instance, the centrifugal pump makes a good outfit in combination with either an electric motor or a steam turbine for the drive is direct connected, and such a set is compact and efficient.

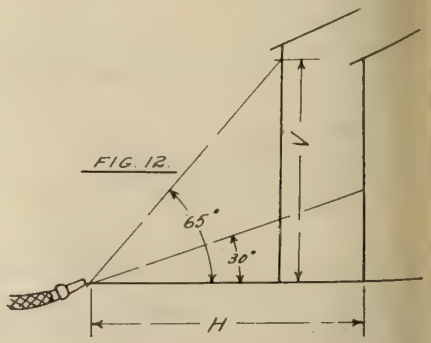

FIG. 12.

FIG. 12.

For use of the fire department, the modern trend is almost wholly toward motorizing. The steamer which has served so faithfully in the past has been outclassed by the gasoline pumper, which by this time is thoroughly reliable, and which has far greater capacity and speed than the steamer of the same weight. Only in Northern localities is there raised an objection to motor apparatus—that of inability to negotiate snow of depth. However, at time of the heaviest snow falls it is impossible for horses to draw any but light loads, and for a team to pull a heavy steamer is practically the same. During the severe blizzard of 1915, one third-class city was so tied up that not a vehicle of any sort moved for three days, except a seven-ton motor-driven pumper, newly purchased, which the driver in his enthusiasm took from the house against orders and successfully made a round of the town.

There is the usual three types, gear, centrifugal, and piston, to select from in the purchase of a motor pump. The gear pump is used by the most manufacturers, and is well and favorably known. Its objections may be summed up as pulsations of the stream and of the hose (not serious), wear of the gear teeth, and trouble with foreign matter if drafting from open water. The centrifugal pump has all the good qualities of stationary centrifugals; the centrifugal is a velocity pump, the pressure it delivers increases with the square of the velocity of the impellers. As there are no close-fitting parts it does not deliver a positive amount of water at all times, and it will not pump at pressures much over 200 pounds per sq. in.; having no fitting parts, it cannot create a vacuum, and when drafting, has to be primed. Its efficiency is the lowest of all the pumps, 65 to 70 per cent. on the verage, but its freedom from trouble and ever ready qualities make it desirable for fire service. Stationary pumps of this type are used for the high-pressure systems in all the big cities.

The piston pump, gasoline driven, has proven quite successful, one make (Ahrens-Fox) having performed a feat never attainable with the steam-driven piston pump, i.e., that of pumping water to the top of the Woolworth Building in New York.

Canadian Machinery Drafting Course—Part VII

We Now Take Up Orthographic Projection, Showing Proper Representation of Objects. These Are All Simple Pieces Found in General Working Practice and Should be Carefully Studied

By J. H. Moore, Associate Editor, Canadian Machinery

THE subject of projection drawing (or orthographic projection as it should be properly termed) is one of very vital importance, and one which, to make a success of this course, must be given fairly good space and treatment. In order to make the same interesting to the students in general, we will use (as far as possible) objects with which the machine apprentice is entirely familiar. In this way the subject becomes more interesting, and the fact that the machine apprentice knows from actual experience that such objects really exist, guarantees that the apprentice in the drafting room will likewise be well aware of their existence. Perhaps a good heading to begin with would be the statement as follows:

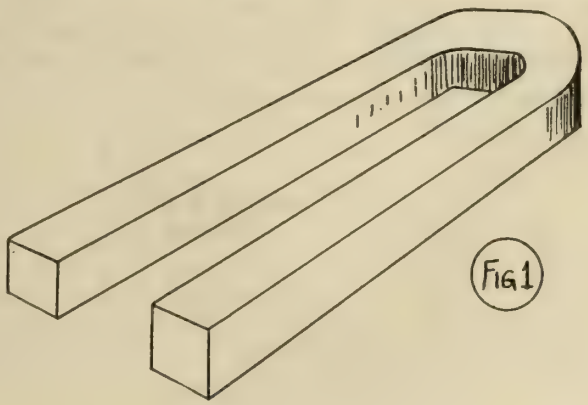
The Representation of Objects

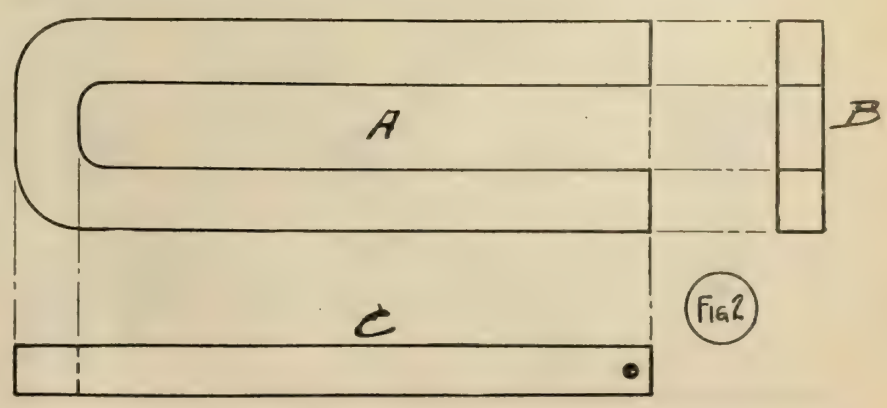
In Fig. 1 we will illustrate a clamp of the usual nature found in most machine shops. Its uses are varied, as far as the various styles of machines used on, but as is well known, its main function is to clamp. This object is drawn as it actually appears when the eye of the observer is in some certain position. As can be well understood, this sketch at Fig. 1 does not show the true length of the various lines, in fact this sketch is simply known as a perspective drawing. Such a sketch is of no practical value to the machinist or tool maker, except to show what the object looks like. Of course, on a simple piece, such as this illustrated, one could easily work from the same if dimensions be placed on it, but without dimensions it is useless as an actual working drawing, for in no way can you measure the true length of the lines.

In order to represent this object in such a manner that any line can be measured directly we employ the method called projection drawing. In a perspective drawing various sides are shown but in a projection drawing only one side is shown at a time, the others being hidden.

Let us illustrate this point by referring to Fig. 2, which shows the same clamp drawn up by the projection method. First let us consider the view A. This view is what is termed a top view, or plan view, namely a drawing which represents the object as if it were resting on a horizontal plane, and the observer looking at it from above.

But from this view we get no idea





how thick this clamp is, and if the slot runs clear through its thickness. In other words we must have a front view, or front elevation. To get a complete idea of the side appearance of the clamp we need a side view or side elevation, so we will now proceed to view B at Fig. 2, where we see the front elevation, that is the view drawn by imagining the eye to be so situated that the observer looks directly at the front of the object. The result is clearly shown.

The side elevation is now drawn, as if it were projected on a vertical plane at right angles to the horizontal plane. The projection of such a view would look like that shown at C.

In order to show these various views in a manner that one view cannot be mistaken for another, they are always arranged on the drawing in a certain fixed and invariable manner. Fig. 3 illustrates another well-known object, namely an angle plate. To illustrate the principle clearly we give dimensions on the perspective sketch, from which we will proceed to make a projection drawing.

Starting at the plan, we draw the view shown at A. We next project the two elevations as illustrated. It is a matter of taste which of these three views you start on, for it makes no difference which is drawn first, but the general arrangement is always as shown.

Any departure from this standard arrangement should be guarded against, but should for some reason or other, the draughtsman decide to change the relation of these views, he should state clearly on his drawing the change made and why.

The broken centre lines are used to show the connection existing between the different views of the object, and to

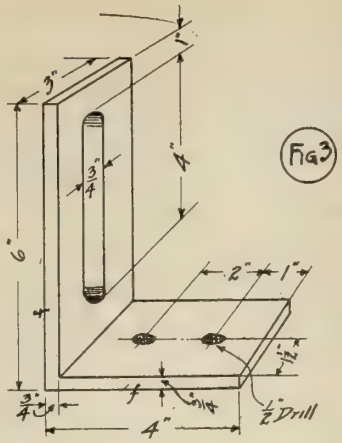


Fig 3

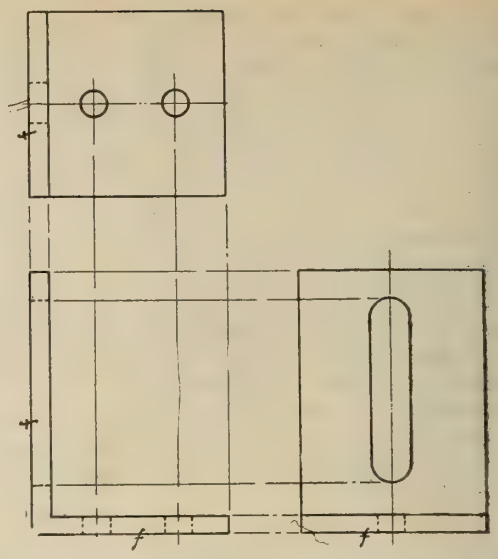


indicate axis of cylindrical surfaces of any kind, but as the best method of following out a subject of this nature is by an actual study of the objects, let us go on to discuss plate No. 7.

As per usual, 9 x 13 in. is to be the actual drawing size, and 9½ x 13½ in. the trimming sizes. Preserve the 1 in. space at the bottom for title purposes as usual.

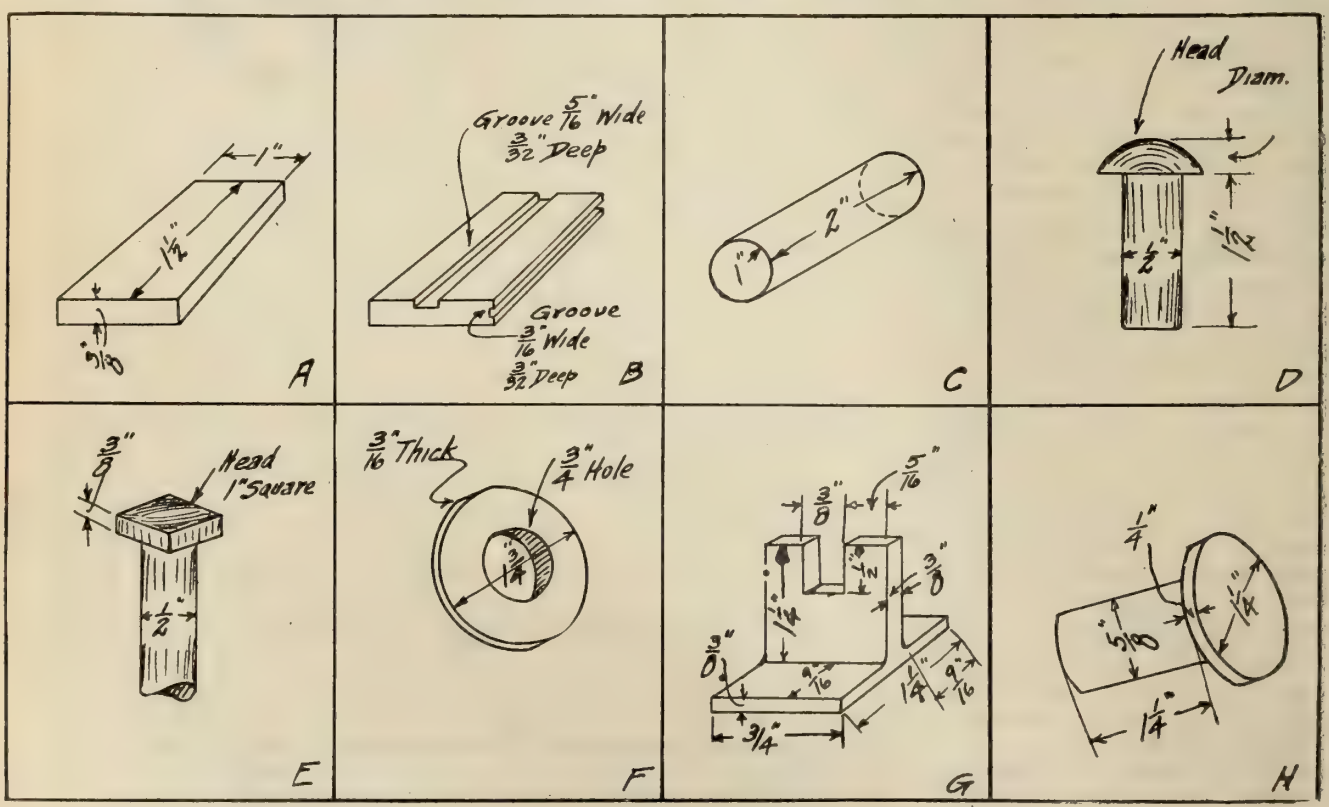
To aid the student we illustrate a chart at Fig. 4, showing rough sketches of the various objects about to be discussed for projection drawing on this plate.

A, the first object, represents a tool steel block 1½ in. long, 1 in. wide and ⅜ in. thick. B represents this same block after a groove had been cut on two of its sides as shown, these grooves being 5-16 in. wide on top, and 3-16 in. wide on side, each being 3-32 in. deep.

At C is illustrated a cylindrical piece of tool steel, while D represents a rivet of the round button head type. E shows a square head bolt, while F represents a round washer, numbers of which can always be seen around a machine shop, of all thicknesses.

In each case dimensions are given, so that to transfer from the perspective to projection becomes an easy matter.

Students will notice that for the objects, C. D, E and F, only two views are given. The reason for this is no doubt self apparent, namely that were we to draw a third view of these pieces, it would be simply a repeat of the side elevation, for the pieces being round the front and side elevations are similar. This, of course, does not always apply, for in the more difficult cases of projec-



tion more views than even the three already spoken of are required, owing to the intricate nature of the object, but as this is really a more advanced subject, we will keep for the present to the three views, or two as the case may be.

We have divided this plate No. 7 into 8 parts as shown, leaving the last two spaces vacant, for a good reason.

In order to make sure that students have grasped the principle of projection, we have illustrated on Fig. 4 two objects G and H. These objects are well known, namely, first G is a small, simple bracket from a machine. All dimensions are plainly marked. H represents a flanged piece of work, usually made up in most machine shops for various types of work.

Now, the object is as follows: Study these sketches carefully, then draw up your idea of what a projection drawing of these pieces would look like.

Put all dimensions on the various views on this plate, and use the illustration of plate No. 7 as shown with this article for a guide. Above all stick to it, and send us your work. The long winter evenings are here, so you have plenty of time and by following up this course you are building up something which will bring you returns at some future date well worth the present sacrifice.

INTERESTING EXHIBIT

The Exhibit of the Black & Decker Mfg. Company, at the November Jobbers' Convention in Chicago will consist of a complete line of the Black & Decker Lectroflater electric air compressors, portable electric drills, electric valve grinders.

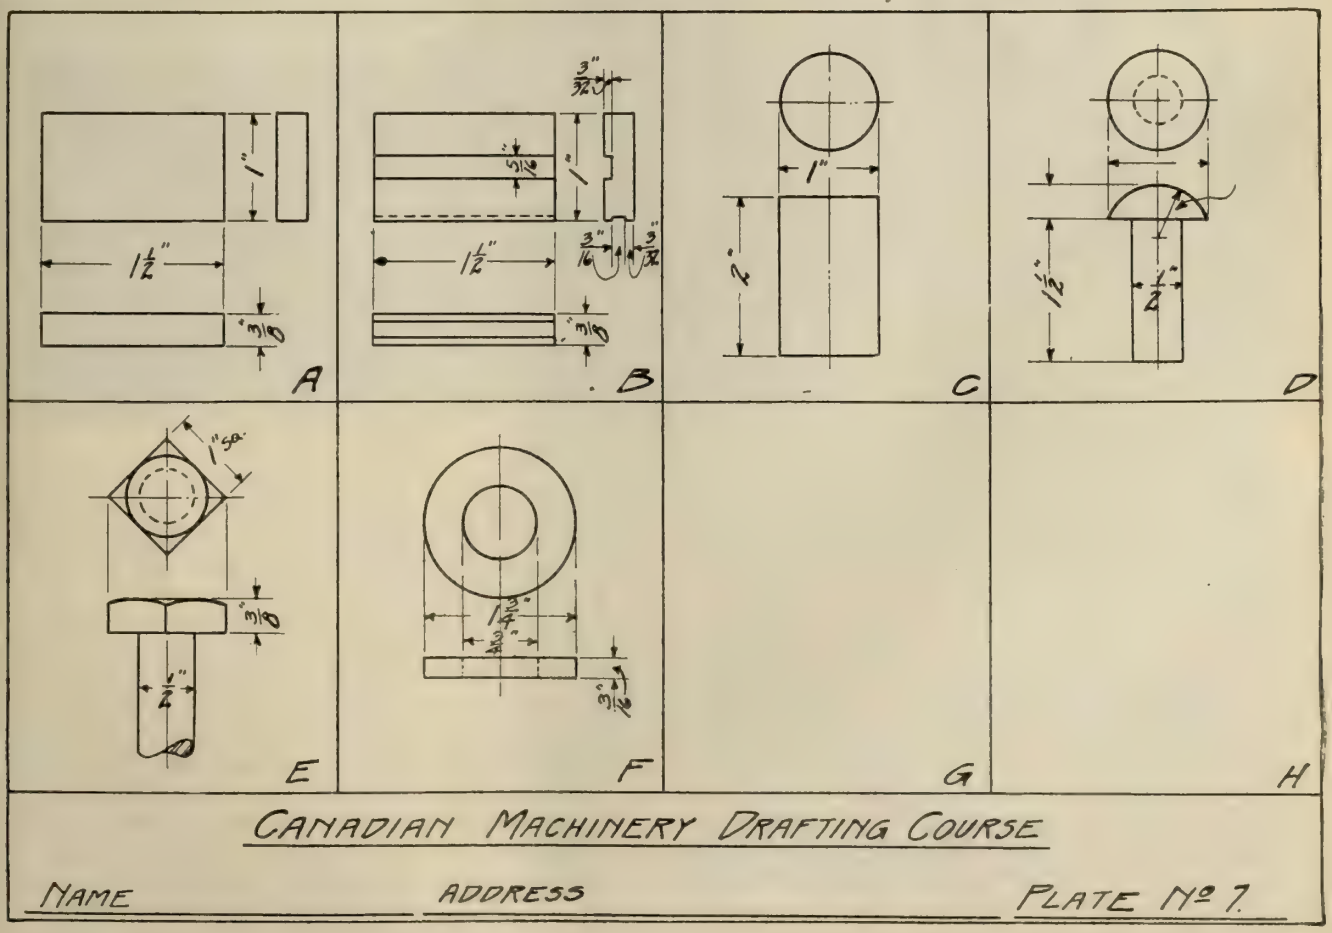
The outstanding characteristics of the electric air compressors is their unit construction, the motor gearing and compressor being built into one housing. The portable electric drills and electric valve grinder are unusually attractive in appearance and are distinguished by "The Pistol Grip and Trigger Switch," a patented method of control similar to an automatic pistol.

The display racks on which the Black & Decker valve grinders and drills will be shown are the same as are being given to the company's stock jobbers for displaying these goods effectively in their stores. They are quite elaborate metal racks nearly six feet high and hold one electric valve grinder and four different size electric drills. They are black enamel and at the top of each is an enamel sign bearing the company's name and arranged with holders for circulars. The supplying of these racks in large numbers to company's stock jobbers throughout the country and in fact all over the world, is an interesting example of advanced merchandising.

Actual electric air compressors, electric drills and electric valve grinders, cut out to show their construction and operation, will be attractively mounted on hexagonal display boards—(the company's trademark being hexagonal in shape)—and the various cut-out models will operate under their own power at slow speeds in order to demonstrate the actual functioning of each part. Complete sets of parts for the different machines will be shown, also mounted on hexagonal boards. Elaborate preparations have been made for next year's campaign, the details of which will be disclosed at the shows by those in charge. For this purpose elaborate portfolios have been prepared, showing the products and going into some detail in regard to their merchandising, showing the type of advertising which the company has been doing and the various sales helps which they have prepared for their jobbers.

It is hoped to make the exhibit unusually attractive, interesting and instructive, and it will doubtless create considerable favorable comment, as it is more than an aggregation of products miscellaneously displayed.

New Bridge Over Niagara. — The C.P.R. has been surveying a route for a new bridge to carry their tracks over the Niagara River. The bridge would be located about one and a half miles above Black Creek. The survey has had the effect of raising property values along the route, and large sums have been paid for farms.



A Unique Ore Unloader for Lake Steamers

This Device, Known as the W.S.M. Automatic Ore Unloader, Has Many Points of Interest Which Will Appeal to Our Readers in General

THE automatic unloader shown in the accompanying illustration is unique in design and has proved through many years of service to be a most successful device for unloading ore cargoes from lake steamers. Although of immense proportions, the design has been simplified and the control perfected to such a point that the machine is the last word in delicacy of control and operation.

The unloader consists of a main framework mounted on trucks which travel along the runway rails which are located approximately as shown in the photograph. The main framework extends back to the rear runway over a temporary storage pile where the ore can be discharged if desired. Between the front and rear runways space is provided for railroad tracks where ore-carrying cars are placed under the machines and loaded with ore for transportation to the furnace plants. The girders of the main framework form a support for runway rails on which a trolley travels. This trolley supports a balanced walking beam, from the outer end of which a stiff bucket leg depends. At the lower end of this leg is the bucket, which is operated by machinery located on the walking beam. All horizontal movements of the bucket are accomplished by means of moving the trolley backward and forward on the girders. The vertical movements of the bucket are accomplished by the operation of the walking beam. The forward portion of the beam being out of balance, the bucket descending by gravity as soon as the brakes of the hoisting mechanism are released.

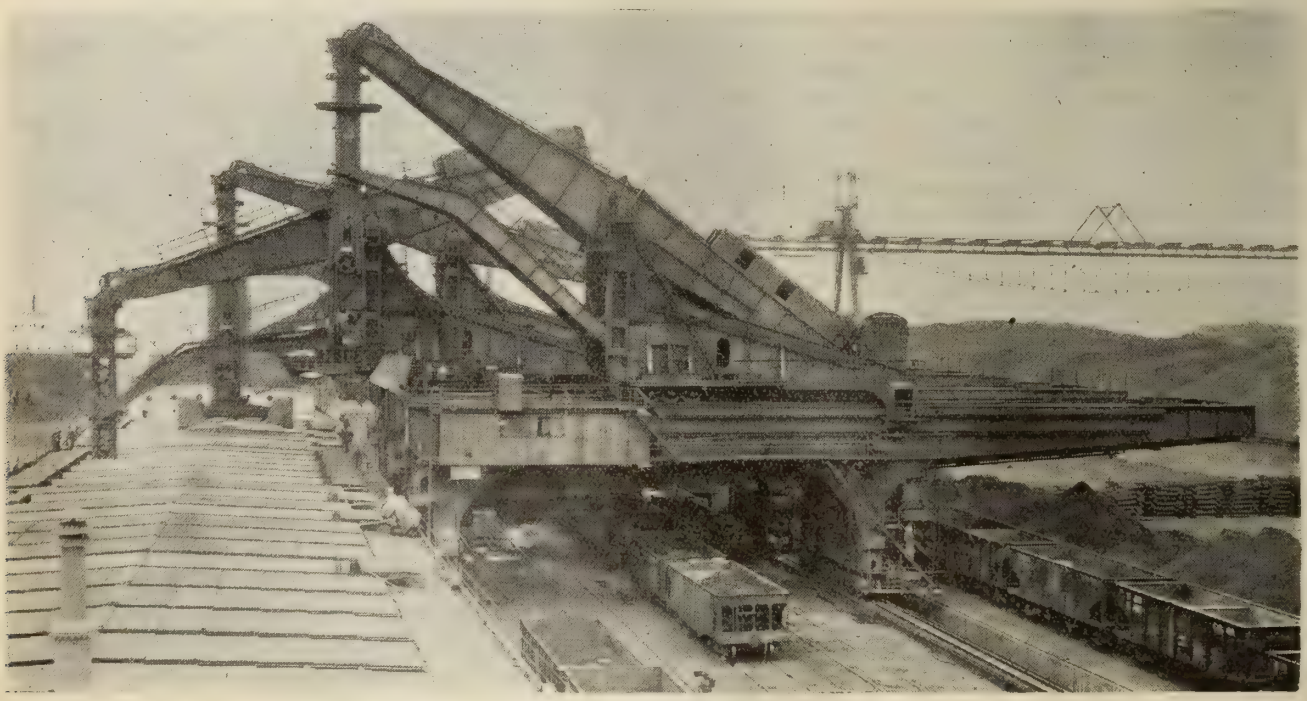
The hoisting mechanism controlling this operation is located in the enclosed house at the rear end of the walking beam. Ropes from the winding drums of this mechanism pass around sheaves located in the rear end of the trolley and are anchored to the rear end of the walking beam.

In addition to the main parts of the machine which we have described, there is also a receiving hopper located at the forward end of the main framework and between the main girders, provided for the purpose of receiving the ore discharged from the bucket. The capacity of this hopper is about three full bucket loads and its purpose is to act as a balancing point for the ore between the bucket and the cars or storage as the case may be. The bottom of the hopper is provided with outlet gates, and the contents discharged as required into a lorry, which runs on an auxiliary track suspended from the under side of the main girders.

The larry, after receiving its load from the main hopper, moves to a point so that its contents can be discharged either into the cars standing on the railroad tracks beneath the main span of the girders or into a temporary storage pile under the cantilever at the rear of the machines. The ore so placed in this temporary stock pile cannot be reclaimed by means of these machines as their function is solely one of unloading the cargo from the ships.

Machines of this type have been made in two sizes, the smaller size having a capacity of ten tons, and the larger size (such as is shown in the photographs) having a capacity of seventeen tons in the bucket shells. The machine shown here is electrically operated throughout and its speeds are regulated so as to operate through a complete cycle in about 50 seconds.

Some idea of the capacities of unloading by this method may be derived from a record which was made in Ashtabula by eight machines of this type having a capacity of fifteen tons each, unloading seven boats having a capacity of 70,000 tons in twenty-two hours' actual time. At other points four machines working in boats having capacities up to 13,000 tons have unloaded these cargoes in about three hours and twenty-five minutes.



CLOSE UP VIEW OF THE UNLOADERS AT WORK.

The operation of the machine is as follows:

After the boat has been placed alongside of the dock, the machine is moved opposite one of the hatches and the bucket is lowered through the hatch into the ore. After filling the bucket the walking beam hoist mechanism is put in operation and the bucket hoisted out of the boat. At the same time, the trolley is traveled back so that the bucket is brought over the main hopper between the girders in the main framework and its contents is discharged into this hop-

per. The bucket is then immediately returned to the boat for another load. The ore in the main hopper is discharged into the larry which has been brought to a point directly underneath the discharge gates of the hopper. The larry hopper is filled and the larry is moved into position so as to be handled by the bucket.

The motor for operating and closing of the bucket is located in the machinery house at the back of the walking beam. Ropes from this bucket-closing mechanism are carried through the walking beam and the bucket leg and attached to a power drum in the bucket leg directly over the operator. This power drum is geared to the closing chain drums, one of which is shown on this photograph. The bucket is opened by reversing the motor and the bucket shells are forced open by means of an opening chain located in the centre of the bucket leg between the two closing chains.

DOCKS AT ASHTABULA. EIGHT UNLOADERS ARE USED, EACH WITH 15-TON BUCKET. 76,000 TONS IN 24 HOURS IN CAPACITY OF THESE DOCKS.

over the desired discharge point and the gates of the larry hopper are opened, discharging the ore as required. The larry hopper is provided with scales so that the contents is accurately weighed and recorded. In this way a car can be loaded to its allowable capacity and an accurate record kept of the amount of ore so discharged into the car, thus eliminating the necessity for the use of track scales.

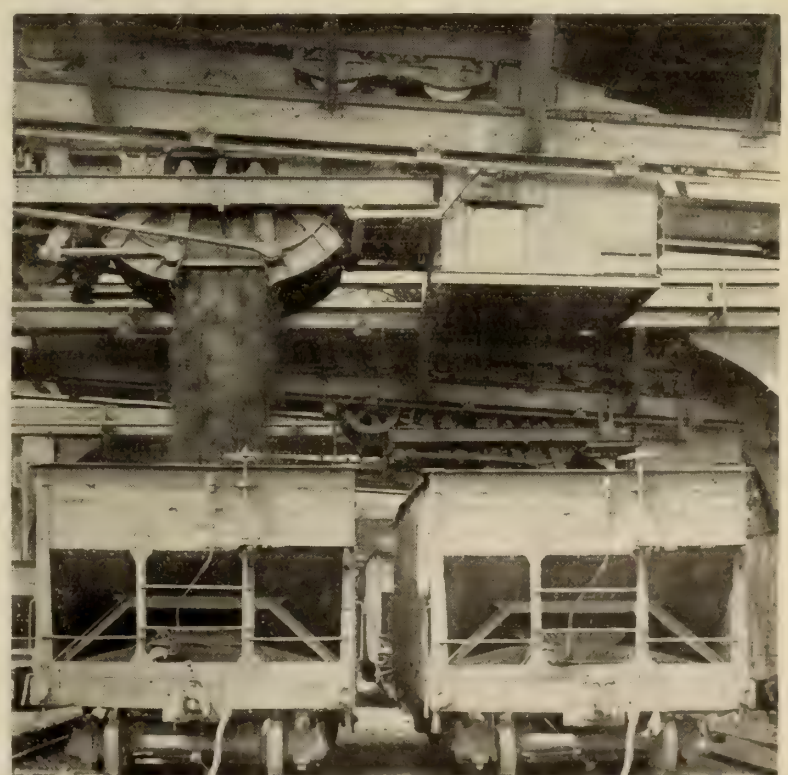
If railroad cars are not available for immediate shipment the larry is traveled to a position on the rear cantilever and its contents discharged into a temporary storage pile, from which it is usually reclaimed for shipment or storage by means of a bridge located on the runway at the rear of the unloader.

Only two operators are required for the entire operation of one of these machines. One of the operators, whose station is in the bucket leg directly over the bucket shells, controls all of the motions of raising and lowering the bucket, of traveling the trolley back and forth and moving the machine along the dock from one hatch to another. The second operator is stationed in a cab on the larry and from this station he controls the movement of the larry, the operation of this larry gates and the weighing of the ore.

The bucket shells are each made of a single piece of plate formed to the shape as shown on this photograph. These bucket shells are usually provided with manganese steel cutting lips, which are essential to resist the abrasive action of the ore. The bucket shells themselves are carried on heavy cast steel arms mounted on rollers traveling in guides in the fixed portion of the lower end of the bucket leg. The position of the operator who controls the operation of the bucket, etc., as previously described, is also shown on this photograph. The view shows the bucket in operation in the hold of the modern ore carrier after most of the ore has been removed and the balance of the ore has been scraped bucket leg itself, the ropes being carried back in the walking beam to a rotating mechanism which is located adjacent to the bucket-closing mechanism. The bucket leg itself is carried on a roller bearing which is attached to the top end of the leg. This motion is introduced for the purpose of turning the bucket at right angles to the hatchway in order to secure as great a reach lengthwise of the boat as possible, thus the bucket is enabled to reach out under the hatches and remove ore which is not directly beneath the hatch opening. The distance from point to point of the bucket shells when open is approximately 21 feet.

The scale larry, into which the main hopper discharges, has a capacity of between 35 and 45 tons, and two larry loads are intended to constitute a full carload of ore. The arrangement of the discharge gates of the larry is clearly shown on this photograph. They are suspended from the sides of the larry frame and operated by connecting rods which attach to cranks, also connected to the main larry frame, these gates being operated by means of a small motor which is carried at the rear of the larry. The gates are so arranged that all or a portion of the contents of the larry may be discharged. The hopper of the larry is suspended in the larry frame on scales so that the contents of the larry may be wholly or partially discharged and be accurately recorded.

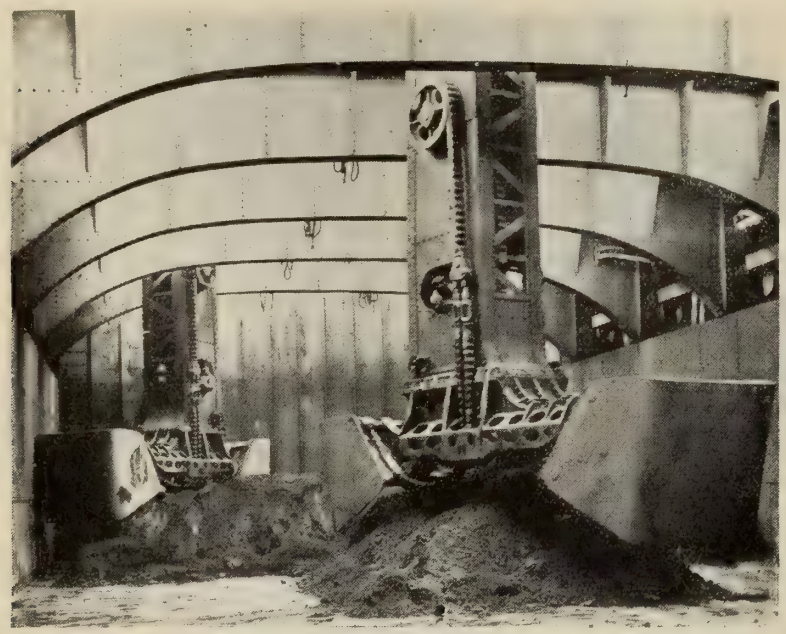
The mechanism for moving the larry back and forth on its track is also located on the larry and consists of winding drums upon which ropes are wound, the end of the rope being attached to the rear end of the cantilever on the main framework. The larry track is in-



Scale larry, into which the main hopper discharges the ore. This larry accurately weighs the ore and discharges it into storage. Cars thus loaded are ready for shipment as they do not require reweighing.

clined and the larry is pulled up the incline by means of these ropes and descends by gravity.

As previously stated, these machines are usually electrically operated through-



Unloader Leg and Bucket at work in the hold of a modern boat are shown above. The leg is so mounted in the walking beam that it can rotate in a circle, allowing the bucket to reach out in all directions. These machines have often unloaded 97 per cent. of a cargo without the help of shovelers. The position of the operator who controls the movements of the bucket is shown above. The distance from point to point of the bucket shell when open is 31 feet.

out. In some cases, however, machines of the same general type have been made to operate by steam and hydraulic cylinders, water being supplied to the operating cylinders by means of a steam accumulator, which furnishes water at a pressure of 1,000 pounds per square inch. Electrically operated machines are usually designed for a 220-volt direct current. Alternating current is never used. The motors required for the equipment of one of these machines are as follows:

	Motor	H.P.
Beam hoist	1	275
Bucket closing	1	120
Bucket rotating	1	25
Trolley travel	1	120
Hopper gates	1	100
Longitudinal travel	1	100
Larry travel	1	150
Larry gates	1	40

The control equipment for these motors is of the magnetic switch type throughout, having master controllers in the operators' cabs in the bucket leg and on the larry.

Electric current is supplied to these machines by means of insulated conductor rails running the length of the main runways. The current is collected from these rails by means of pickup shoes and distributed to the various portions of the machine. A similar collecting device is also employed for supplying the main current to the trolley. Conductor rails are attached to the main framework of the machine and the current collected from these rails by means of pickup shoes attached to the trolley.

Points of superiority claimed for this Wellman-Seaver-Morgan Ore Unloader are as follows:

The design is very heavy; there is little to get out of order, resulting in low maintenance cost per ton of material handled.

The control is accurate and positive, and manual labor is reduced to a minimum.

The bucket is positively guided in passing through the hatches of ships, thus eliminating the danger of damage either to the boat or to the machines, arising from the use of rope-suspended buckets.

The operator travels with the bucket into the boat, and can always see exactly what he is doing.

The bucket is of extremely large capacity, but is so suspended from the walking beam that the weight resting on the tank top of a boat is less than one-third of the weight of a rope-suspended bucket of equal capacity. In fact it is impracticable to use a rope-operated bucket of anything like the size attained on these unloaders.

One particularly important point to be considered is the extremely low cost obtainable with these machines. Records extending over long periods show unloading cost ranging from 2½ to 4½ cents per ton, which includes superintendence, labor, repairs and materials on the machines, as well as the cost for power and light.

On account of the high capacity of these machines, the number of units required is less by a considerable margin than of a smaller type lighter machine, which results immediately in a decreased cost of operation for the reason that a fewer number of skilled operators is required.

Again, on account of the extreme reach of the bucket, it is possible for the machine to discharge a very much higher percentage of a ship's cargo than can be accomplished by ordinary rope-operated buckets. The bucket can be rotated at right angles to the hatch and reach out for ore which would be entirely inaccessible to an ordinary bucket.

It can be conclusively shown in plants where large tonnages are to be handled that there is a distinct saving in first cost as well as a yearly saving in the cost of operation over any other type of machine.

This unloader is not a combined machine. It is an unloader pure and simple, and it accomplishes its work well.

The Canadian Engineering Standard Association

IT IS not generally known that we have in Canada an association known as the Canadian Engineering Standards Association.

The Purpose of the Association

The Canadian Engineering Standards Association was formed in 1919 with the object of carrying out in Canada, for the benefit of Canadian industry, work similar to that done in England by the British Engineering Standards Association, which has proved of such great industrial value. The Canadian Engineering Standards Association is not a Government institution, although it is recognized by the Canadian Government. The members, who serve on its committees gratuitously, are qualified by their technical and industrial standing to represent the interests of manufacturers, engineers and users, and are nominated by such bodies as the Canadian Manufacturers' Association, the Canadian Mining Institute, the Engineering Institute of Canada, the engineering schools of the universities, the railway services, important industrial firms and the great purchasing departments of the Canadian Government.

The association has now been incorporated by Dominion charter.

The association is supported by contributions from the technical and industrial societies interested, as well as from individual firms, and these are supplemented by a grant from the Dominion Government.

Method of Work

When a request or suggestion is received from some responsible firm or person to the effect that the formulation or revision of a Canadian standard is desirable, the association confers with the various interests likely to be affected by the establishment of such a stand-

ard, and arranges for the organization of a committee to consider the matter. This committee includes representatives of the producers and users of the standard in question together with such technical advisers as may be considered desirable. The selection of such a working committee is accomplished through the proper sectional committee of the association under the chairmanship of a member of the association. If the committee so formed recommends the adoption or modification of a standard, its findings are reviewed by the association, the main committee of which must be thoroughly satisfied that full consideration has been given to the subject before it authorizes publication by the association.

The actual discussions as regards technical details are thus carried out by specially chosen representatives of the manufacturers and purchasers, and the various interests, whether of the producer, the user, or the engineer, are safeguarded, since all these parties have a voice in the decisions reached. In this way it is clear that before a report, defining a Canadian standard is issued or modified, the effective approval of all concerned will have been obtained.

The services of the various sectional and sub-committees are of course available for the periodic revision of their reports, this being necessary in order to avoid any risk of retaining a standard in use after improvements or changes of practice have rendered it obsolete in any respect.

There is reason to believe that the success of the work done by the British Engineering Standards Association in the past has been largely due to the careful way in which its main committee has reviewed the work of its various sectional and other committees.

The C.E.S.A. standard specifications will, as a rule, contain simply the technical clauses necessary for the purchase of the product to which the specification relates, together with such tables and diagrams as may be required for their explanation.

Meaning of Standardization

In order to avoid misunderstanding it may be pointed out that the term "standardization" refers primarily to the preparation of such designs, dimensions or specifications in industrial, manufacturing, or construction work as will be generally accepted and worked to by all concerned. In the case, for instance, of a machine component, if its principal dimensions and characteristics are standardized, the number of types or patterns to be made or kept in stock commercially is at once reduced, lessening accordingly the cost of manufacture and handling, with corresponding saving and convenience to users.

An example of economy attained in this manner would be afforded if the various Canadian railway administrations would agree with the steel makers to adopt a standard Canadian section and specification for rails and track fastenings. This action would not only reduce the number of different rolls to be cut and used by the rail mills, but would enable material to be rolled for stock direct from the billets at less cost and with a certainty that they would be acceptable to any railway. The railways would simplify their practice, avoiding the use of rails and fastenings differing in form and material only in comparatively unimportant details, and would benefit by the higher and more uniform quality of the product. Some progress towards this desirable result has already been made.

Similar opportunities for substantial saving in the cost of manufactured products and for protecting the interests of the user now occur in many other Canadian manufacturing industries wherever articles and materials may be so standardized by common agreement between the producer and user as to permit their production in economical quantities while still satisfying the requirements of the purchasers. No organization has hitherto existed in Canada for bringing these various interests together and inducing them to agree on a mutually satisfactory design or specification.

The Canadian Engineering Standards Association, like the British Engineering Standards Association, does not as a body decide upon the details of its standards, but organizes and reviews the findings of a representative committee for each particular standard suggested, thus insuring that all interests are properly considered and making certain that any recommended standard has been carefully investigated before it is issued. No standard that is not based on mutual agreement arrived at in this manner is likely to receive general endorsement and adoption.

Since the commencement of their activities three months ago, great progress has been made.

Requests for action have been received and committees have been formed, or are in process of formation, dealing with the following subjects: Aircraft parts, electrical work, rails and track, wire rope, steel bridges and construction, with the view of obtaining agreement on Canadian specifications or standards which will be acceptable to all concerned.

In this work, consideration will of course first be given to any existing specifications or standards which have proved satisfactory in Canada, Great Britain, and the United States for similar work.

This association has been requested by the British Engineering Standards Association (the corresponding organization in Great Britain) to undertake the distribution of its publications in Canada, and for this purpose has been furnished with most of the reports of the British Engineering Standards Association. The list to follow does not include all the publications of the British Engineering Standards Association, but covers those of most recent issue. Copies are for sale at the prices stated.

Report No. C L 3750. "Interim Memorandum on French Metric Screw Threads for Aircraft Purposes," 15c net.

Report No. 10-1904. Revised July, 1918. "British Standard Tables of Pipe Flanges," 25c net.

Report No. 15-1912. Revised August, 1912. "British Standard Specification for Structural Steel for Bridges, etc., and General Building Construction," 25c net.

Report No. 21-1909. Revised November, 1909. "Report on British Standard Pipe Threads for Iron or Steel Pipes and Tubes," 25c net.

Report No. 37-1919. Revised January, 1919. "British Standard Specification for Electricity Meters," 25c net.

Report No. 41-1908. "British Standard Specification for Cast Iron Spigot and Socket Flue or Smoke Pipes," 25c net.

Report No. 44-1909. "British Standard Specification for Cast Iron Pipes for Hydraulic Power," 25c net.

Report No. 45-1917. Revised September, 1917. "Report on British Standard Dimensions for Sparking Plugs for Internal Combustion Engines," 25c net.

Report No. 46-1909. "British Standard Specifications for Keys and Keyways," 25c net.

Report No. 63-1913. "British Standard Specifications for Sizes of Broken Stone and Chippings," 25c net.

Report No. 65-1914. "British Standard Specification for Salt-Glazed Ware Pipes," 25c net.

Report No. 71-1917. "Report on British Standard Dimensions of Wheel Rims and Tyre Bands for Solid Rubber Tyres for Automobiles," 25c net.

Report No. 72-1917. Revised September, 1917. "British Standard Rules for Electrical Machinery." (Excluding motors for traction purposes), 25c.

Report No. 74-1917. Revised September, 1917. "British Standard Specification for Charging Plug and Socket, for Vehicles Propelled by Electric Secondary Batteries," 25c net.

Report No. 75-1916. "British Standard Specifications for Wrought Steel for Automobiles," 25c net.

Report No. 76-1916. "British Standard Nomenclature of Tars, Pitches, Bitumens and Asphalts When Used for Road Purposes and British Standard Specification for Tar and Pitch for Road Purposes," 25c net.

Report No. 82-1919. "British Standard Specification for Starters for Electric Motors." (Face-plate type), 25c net.

Report No. 84-1918. "Report on British Standard Fine (B.S.F.) Screw Threads and Their Tolerances," 25c net.

Report No. 88-1919. "British Standard Specification for Electric Cut-Outs for Low Pressure, Type O," 25c net.

These reports are concise and complete and well worth the price.

WELDING AND CUTTING

Army Welding Schools*

By R. J. KEHL†

ORIGINALLY the shop work of the Ordnance Department was planned to come under two heads: namely, mobile repair shops and base shops.

The mobile shops organized quite elaborate courses of instruction, which were given at the Rock Island Arsenal, at Peoria, Illinois, Clintonville, Wisconsin and Kenosha, Wisconsin. Because those shops were to be sent to France one at a time, it was quite possible to arrange good courses of training for their men. Men who had some welding experience and when who were good mechanics, but who had had no previous experience in oxy-acetylene welding were given instruction at these schools.

In the case of base shops, conditions were entirely different. It was expected that all the base equipment and personnel would arrive in France early in the spring of 1918. These shops, therefore, endeavored to enlist men who had had considerable experience in oxy-acetylene welding, as well as for the other trades required for the shops. It was, of course, understood that there would not be enough first-class operators, but it was thought that we would be able to train men in France, using them as helpers to the experienced welders.

When I arrived in France, in March, I went immediately to Advance Depot No. 1. The first machine shop, which had been erected in December, had been burned down, and the second shop was just about ready to commence operating. Considerable machinery had been damaged in the fire, and in transportation, and a great deal of welding work had to be done before the shop could be run in good shape. When I inquired as to why a welder had not been put on the job, I was told that they did not have one. They had had a blacksmith who claimed to know quite a bit about welding, but he had made a failure of every job which he had attempted, so, although they knew that their only hope for getting the shop running was to employ the oxy-acetylene process, nevertheless they had very little faith in its ability.

The only equipment at the depot was a French combination welding and cutting blowpipe, which operated off a portable acetylene generator of about 25 pounds carbide capacity. There was no oxygen regulator with the outfit. A copper tube about ⅛-inch in diameter carried the oxygen to the blowpipe at cylinder pressure. Four cylinders of oxygen, and two of acetylene, of about 150 cubic feet each; about 10 pounds cast iron rods, all square, and most of them larger than ⅜ inch, and about 5 pounds square aluminum rod over ½ inch, were all the supplies on hand.

Lump carbide was the only size available, so it was necessary to break carbide to charge the generator, as the instructions said, to "the size of coffee."

After the generator had been put in operation and the blowpipe started, it was apparent that a new beginner could not be trusted with that apparatus on work that could not be allowed to fail. Therefore I had to do practically all the welding myself, using the men only as helpers, except for a few cutting jobs, for the first five weeks.

About the first of May we received in salvage, a good French outfit, consisting of a welding blowpipe, a cutting blowpipe, oxygen regulators, and an acetylene regulator. With this better equipment we were able to get along quite well.

Soon the mobile shops commenced coming through the depot to receive final instruction in artillery material and other work for which the men were to be specialists with their particular shop. Some of the welders with these shops were excellent operators, some had had instruction in the mobile classes in the States, but a great many, although they were classed as welders, knew practically nothing about welding, or at least good welding practice.

Most of the work up to July was repairs to broken machinery and equipment for our own shop, the local railroad repair shop, and other branches of the service at the depot, and some artillery repairs.

To give instruction on work of this sort was a pretty difficult proposition. Men who were good mechanics and adapted themselves readily to welding, received considerable training, and quite a few good operators were turned out. But those who did not adapt themselves to welding readily, and should have been given the most attention and practice, did not receive it, because they could not be trusted to do anything but the simplest jobs.

The work covered a broad range of repairs and included jobs which ordinarily would not have been attempted. Such parts as typewriter arms, typewriter carriage ways, various small arms parts, automobile springs and very badly broken castings were attempted and successfully handled. The only job which failed was a small white metal casting.

Dozens of levers, arms, hand-wheels, brackets and pulleys for various machine tools were welded for our own shops each week. For the Air Service, a broken shaper base, aluminum magneto brackets for generator sets were repaired, and some lead burning was done. For the Railroad Shop, only locomotive brackets, levers, and other small work was welded by us, the larger repair work being sent to the main railroad repair shops, about 150 miles back. For the Motor Transportation Corps, cracked engine cylinders, motorcycle forks, worn valves, and other automobile and motorcycle repairs were made. Even several dozen automobile springs were welded because of the inability to obtain new springs to replace them. Broken truck and tractor parts were repaired for vehicles received from the States and uncrated at the depot. Hot water heater sections and automobile repairs were handled for the Red Cross.

Perhaps the most complicated job was a three-step pulley for a 16-inch lathe, which had fallen down from the shafting and was broken into 15 parts, all the way from small pieces to one piece about one-third of the pulley. This job required considerable patch work and scheming to insure the pieces being true and to avoid cracking as each little piece was gradually added to the main part.

Various parts of gun mounts, gun carriages, and other caissons were repaired. Many of these were bronze. Machine gun tripods which had come in in salvage with corners shot off, holes pierced through them, and otherwise damaged, were welded, straightened and put back in service. Upon several occasions, advantage was taken of the oxy-acetylene blowpipe to apply local heat to trails which had been distorted in action.

The cutting blowpipe was used to cut I-beams for shafting stringers and to rough out large quantities of wrenches for the 75-millimeter gun repair tool

*Paper read at Annual Convention International Acetylene Association, N.Y.

†Engineer Oxweld Acetylene Co., formerly First Lieut. Ordnance Dept., A.E.F.

sets, to save time, machining. The ball and the base of railroad rails were sliced off so that the machine shops could use the stock to make lathe and shaper tools. By careful manipulation of the cutting blowpipe, gun cradles were notched or split as the case required, to permit the removal of the gun and recoil mechanism from field pieces which had been badly damaged in action.

In July the shops received orders to make up about 200 Howitzer mounts, each of which required two butt welds on 2-inch round steel bars, and two corner welds, each 15 inches long, on ¾ in. plate. After the shops had been on this work for about a week the welders were falling behind because of lack of equipment. At that time the engineers at the depot received a 100-pound portable Oxweld generator, with welding and cutting equipment. After considerable negotiations they finally consented to loan us their generator and equipment on the basis that we would handle all their repair work. When I say that we had eight men doing nothing but break lump carbide down to the size required for the generator you will realize that the generator was being heavily taxed.

Because most of the men were to go out with mobile shops, and would have to depend upon their own ability and skill, an effort was made to have them appreciate that the success of welding depends more upon the correct handling of the work than just upon running in the filling rod. They were instructed to study the different possible methods of a job and to then select the method which would ensure the best results. They were trained to watch the whole work, while doing the actual welding, and be able to reason out the cause of any difficulty they might encounter and be able to overcome or counteract the cause.

It was quite difficult to obtain supplies from the French, both rods, fluxes and gas supplies, and as a matter of fact most of our supplies came from the Quartermaster's Department, and we had to taken woven wire and unwind it for welding wire. Hundreds of tons of supplies for the different departments did not get to France until August and September. The initial supply, from twenty-five to fifty pounds, that came with each outfit, was used up within a couple of weeks after outfit was put into service, and we had to depend on the French as far as we could for our supply, and they were not very generous with it. An order for five pounds of rods had to go through the Minister of Munitions at Paris.

SOLDERING FOR SHOP MEN

By Donald A. Hampson

Repair and maintenance work calls for ability to turn one's hand to many a trick that is foreign to every-day machine shop practice. Soldering is one of these tricks, yet a great many machinists are totally unfamiliar with such work, or have only seen it done, while still others despise such a method of making repairs. Soldering is not to be despised—it fills a very definite place—a good soldered joint is better than a poorly welded one. Many jobs that could easily be fixed up with solder are repaired by more expensive methods and by renewals. It is not a hard matter to make a good job of soldering if a few essentials are understood, nor is there required any expensive equipment.

Cleanliness is the first and last requisite for a successful job. The surface of the work must be mechanically and chemically clean. Mechanical cleanness is obtained by machining, filing, and scraping, together with the use of emery cloth that has not been contaminated with dirt and grease. Brass castings may be soldered on the surface if clean, but with cast iron it is necessary to cut or file off the outer surface or skin to expose the fresh metal. Cleaning should be carried a quarter of an inch beyond any part which the solder will touch so that by no chance will be work be retarded by the iron's slipping on to an unclean spot and thus carry dirt back to the joint being made.

The chemical cleanliness is obtained by the application of muriatic acid to the surfaces being joined. This provides for all necessary cleaning and prevents oxidation of the surface during the work. If it happens that the work pieces are galvanized or of zinc, then the commercial acid is used just as it is, but if any other metals are being handled (and the majority of jobs are such) then the acid must have dissolved in it all the zinc which can be absorbed by the acid; this "cut" acid is ready for use and is preferably prepared in small quantities so as to have always fresh acid on hand, and that as clean as such things can be kept which are being dipped into and exposed to air and swabs.

Sal-ammoniac is the most commonly used flux for soldering. Rubbing the hot iron over the surface of this is sufficient. Some men imbed a small amount of solder in a cake of sal-ammoniac and tin the iron by rolling the iron around in this hole, but it cannot be said to be good practice, for the hole gets constantly bigger and less efficient, finally getting bored clear through the cake, spoiling a chunk that at present prices may be worth two or three dollars. Tinsmiths invariably keep the surface of such a cake flat on top and use a holder or container that allows the greatest wear from the rather expensive chemical in use, a couple of movements per side of the iron is all sufficient.

Both the iron and the work must be "tinned" before any kind of a job can be done. This is the second great law of soldering. Oil, grease, dirt, all these prevent the tinning of iron and work, and they have to be removed. Tinning is the process of coating the surface with a thin layer of solder. So far as the work is concerned tinning may be done as a separate operation previous to joining the two pieces, or it may be done as a part of the work with the pieces clamped together. The iron, however, is always tinned before it is applied to the work. Soldering jobs are usually either joining two separate pieces together or filling up cracks, and in both cases it is preferable to tin the surfaces separately because when that is once done it is an easy matter to place more solder in the form of a bond between the two in whatever form or amount is desired.

Some materials resist tinning more than others. With those that offer greater resistance, patience is required to secure the coating, and the iron must be rubbed for some time on the surface before the result is secured, in the meantime keeping dirt and oxidation from accumulating. It is a help in tinning cast iron to coat the surface with a thin layer of copper by rubbing on blue vitriol, the surface having first been machined or filed.

Lack of heat is a detriment to soldering, in fact, most beginners fall down on this one point, and they try to solder with a cold iron and to make solder stick to a cold surface. The iron itself, however, should not be overheated; this is a common mistake around machine shops where the forge fire is used to heat, and where it is very easy to raise the iron to red heat. Soldering "irons" are made with a copper bit, and the red heat is injurious to copper; moreover the red heat burns off the tinned surface of the iron, necessitating doing this part of the work over again. A temperature of 400° Fahr. will melt solder, and there is no need to go a great deal above this.

The function of the iron is three-fold: to carry the solder to the work, to heat the work, and to distribute, or place the solder where wanted. If the iron consisted of the point only, it would fail in the first two functions, but it does not, and we have a large mass of copper back of the point which feeds the heat down to where it is used. Where sheet metal is being soldered the heat from the iron is sufficient, but where the parts are bulky it is preferable and quicker to heat the work in some sort of a clean flame, bringing the work up to about a straw color on steel.

Cast iron requires more heat than steel or brass. Aluminum requires a hotter iron than the other metals and also a special aluminum solder. Ordinary solder will not stick to aluminum; usually aluminum is soldered without any flux, or if any is used it is a specially prepared composition.

Separate parts being jointed by soldering require some sort of fastening to keep them together and in true relation until the bond has cooled. The work may be clamped on a surface plate or held in a vise, or it may be screwed and riveted together, or it may be wired.

Shelburne. — The Shelburne Shipbuilders, Limited, launched a fine three-masted schooner from their yards recently. She was built for the W. & T. Hollett interest, of Burin, Nfld., for their fleet of coasting vessels. The new vessel was christened Donald II, registers 230 tons, and has the 12 years' classification in Bureau Veritas. The keel for an auxiliary schooner is laid in the same yard.

DEVELOPMENTS IN SHOP EQUIPMENT

A "NEW CRANE" 40 YEARS OLD ENTERS THE FIELD

The Lane Manufacturing Co., Montpelier, Vt., established for 70 years, built their first rope-driven overhead travelling crane about 40 years ago. Many of these cranes installed in the early eighties are still rendering full service.

Until this year, all efforts of this firm have been confined principally to the stone working field. About 1893, with the increased development of electric power, the Lane Crane was adapted to electric drive, and during the past twenty years a large number of these electrically driven cranes have been installed largely in their original field—the stone-working field—throughout the country. Although most of the installations have been in the New England States, Lane Cranes are now in service in many states from the Atlantic to the Pacific.

Hence, although so long established, it is easy to understand why this type of crane has not been better known in fields outside of the stone-working trade.

They have now appointed as their sole crane agents, N. B. Payne & Co., 25 Church street, N.Y., who will make it their business to give this crane a broad distribution throughout the United States—wherever cranes are needed. Herewith, are a few of the arguments that are being presented by N. B. Payne & Co.

Two Motors Give Three Movements

A notable characteristic of the Lane Electric Crane is the employment of two motors for three movements. Both motors are the constant speed, non-reversing type, which eliminates the use of controllers and complex wiring. Control of all movements, including that of direction, by means of a series of friction cones, is mechanical.

This design effects a saving in electric power which is ordinarily lost in frequent quick stops and reversals, and speeding up or slowing down of variable speed reversing motors.

Originally Lane Cranes were furnished with timber bridge girders, stayed with steel truss rods fastened to cast iron bridge trucks and having a safety factor of about 7. This construction has the advantage of being exceptionally light for a given capacity. Where desired timber bridge girders, as shown in Fig. 1, are still furnished. In fact, bridges are now supplied in three styles:

No. 1.—For short spans; rolled steel I beams, reinforced with inverted channels riveted to the top flanges when necessary.

No. 2.—Steel girders of the lattice box section type for long spans, Fig. 2.

No. 3.—Heavy timbers of long leaf yellow pine, reinforced by large steel truss rods, as shown by Fig. 1.

In all cases, these bridges are designed with a large factor of safety—at least 5, and with ample strength to sustain the load without undue deflection, horizontally or vertically.

The bridge girders of this crane are supported by cast iron end trucks, provided with cast iron double flange chilled wheels, which have steel axles running in renewable bearings. The trolley is made of cast iron, is designed for rigidity, compactness, accessibility of all parts, and is suitably reinforced with steel tension rods. The sides are joined together by several large steel shafts. Power for hoist and trolley movements is transmitted by friction cones through steel worms, engaging bronze gears running in oil. These friction cones are plainly visible in Fig. 3.

The worm-gear drive is a simple and effective load brake, being controlled by a convenient hand wheel. Two speeds of the hook are furnished with one part of rope. A luff block is provided with a hook and hinged housed sheave, so that by running the line through this sheave and attaching the single rope hook to a girt on the underside of the trolley a two-part reaving of the rope is effected, thereby dividing the first two speeds by 2 and doubling the power, supplying 4 hoist speeds.

For example: The following are approximately the speeds for a 10-ton standard crane.

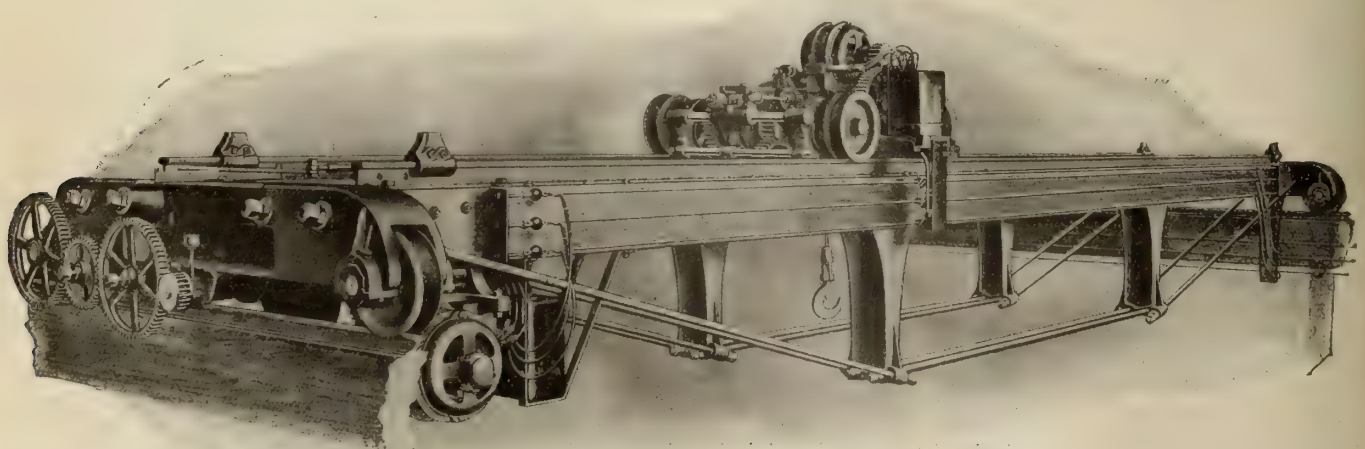
No load—40 feet per minute with one part of rope.

2½ tons—20 feet per minute with one part of rope.

5 tons—10 feet per minute with two parts of rope.

10 tons—5 feet per minute, with two parts of rope.

The hoist motor, through the same power cones, operates the trolley motion on the bridge at approximately 100



GENERAL VIEW OF LANE OVERHEAD ELECTRIC CRANE.

feet per minute. The reverse is obtained in the same manner as with the hoist movement. All movements are controlled by hand wheels. There is no complicated wiring, there are no large controllers and there are no hot resistances, hence, no ability to handle delicate electrical equipment is required of the operator.

The bridge motor drives a friction disc by transmission through a pair of opposed cones; alternately contacting therewith. Control of the bridge travel movement in either direction is effected by shifting the cones by means of a lever connected to a rod running the full length of the bridge convenient to the operator's left hand.

A distinctive feature inherent in this crane is the control of all movements by the operator while seated on the trolley. There he always has a clear view over the hook as well as of all other points below the crane.

In practice, expert crane users have found that the operator is able to place the load quickly and with accuracy, also effecting a saving of considerable time in placing the hook for attachment to the load. The comfort of the operator in sitting at his work is a feature worthy of consideration.

Readers may be interested in a book of testimonial letters on Lane Cranes in the possession of N. B. Payne & Co., which is available to anyone intereted.

In summing up, it is claimed by the manufacturers that this crane has five special points of superior merit, as follows:

1st: Maximum longevity of service—a record of 30 years.

2nd: Minimum power and repair cost.

3rd: Great overload capacity.

4th: High return value on capital investment: and

5th: The crane can be operated by inexperienced labor.

ATTRACTIVE CATALOGUE

The Canadian Foundries and Forgings have issued a very attractive catalogue, No. 4, on their line of drop forgings and drop-forged tools, produced at the Canadian Billings and Spencer plant, Welland, Ont.

In this catalogue is shown a full line of forged steel wrenches of all kinds, also illustrating their display board for such tools.

Machine, engineers', double head S, 15° double head, and general service wrenches are shown, also various adjustable and automobile types. Knife handle wrenches, Stilson wrenches, screw-drivers, pliers, hammers, turnbuckles, thumb nut blanks, weldless eye nuts, eye bolts, forged steel nuts, drop-forged crank shafts, connecting rods, etc., etc., are shown throughout this book.

To anyone interested in drop forgings or wrenches, this catalogue will be a splendid addition to their library.

NEW BULLETINS

The Hergi Manufacturing Co., 75 Third Street, Bridgeport, Conn., have issued attractive bulletins Nos. 10, 11, 12 and 13 on their line of portable electric machinery.

Various grinding wheels, die sinking outfit, scraping outfit, and screw-driving outfit are described in detail. To anyone interested in such a line of machinery, this booklet will prove well worth while.

FORGED CUTTER TOOL HOLDERS

J. H. Williams & Co., with works at Brooklyn and Buffalo, N.Y., have added to their well-known line of "Agrippa" tool holders, their new system of cutting tools, Williams' "Vulcan" forged cutter tool holders. Holders which embodied this principle, making possible the use of what is practically a solid tool without its expense, were first designed and used in their shops many years ago; they have been developed and perfected to meet the demands of those who prefer the solid, forged type of tool. This construction eliminates the great cost of the old, solid tool and at the same time retains its advantages; each holder, by the mere insertion of small high-speed forged cutters, is adapted to the heaviest service in any regular machining operation on lathe, planer, shaper, etc. Consequently the economy and convenience of this line, when installed as standard shop equipment, is at once apparent, as all blacksmith work, to say nothing of the very considerable investment necessitated by heavy, solid forged tools of costly high-speed steel, is eliminated.

The supply of cutters for such a shop can be maintained in readiness for instant service by the man in charge of the tool room at practically no expense for grinding, so that the machine operator may have constantly available an ample stock for all regular needs. Duplicate lines of important shapes and sizes with but slight additional investment will insure the operator against interruption; he may thus devote his entire attention to production only.

The holders are all drop-forged from a fine grade of special steel, so heat-treated as to develop its maximum toughness and stiffness. They are very simple in construction, being composed of but three parts: holder proper, square head cam, and locking pin, all of unusual strength and exceptional wearing quality; they hold the cutter in an immovably rigid grip. The construction is shown by phantom cut.

The cutters, extra heavy in design, are drop-forged from "Agrippa" high-speed steel, and are finished and hardened ready for use. They are furnished in a wide range of sizes and types: Side, diamond point, roughing, hog nose, flat nose, threading, etc., etc. The method of locking provides the necessary bearing to support the cutting pressure and prevents all rocking movement of the cutter itself.

Is the Victory Loan Secure?

NOW that the people of Canada have given to the Government of the country over $600,000,000, the question arises, "What are they going to do with it?"

It is not a very hard matter to finance a country or an institution or an individual as long as the money hangs out. A good way to judge the effect of this sort of business on a nation is to judge it on an individual, for after all, a nation is simply a collection of individuals.

Take any man and hand over to him plenty of money, and he will get along nicely—for a time.

Take any country and hand over to its Government plenty of money and it will get along nicely—for a time.

What develops men is to get out and work and plan and sacrifice.

And the same things that develop men will develop nations.

It is a good thing for a Government, if it must owe money, to owe that money to its own people. The payments of interest go to our own people, and the holder of bonds feels a new and a greater interest in his country, It may be selfishness, but he realizes that the country must pay him back his money, and it is up to him to make the country able to discharge that obligation. Everything he can do to make the country more capable of paying its debts is increasing the security that he likes to see surrounding his investment.

Canada's ability to pay back her debts is not going to be increased by an adherence to the idea that your part in the work is cutting down output and increasing costs.

Canada's ability to pay is going to come from her applied ability to produce, to grow, to manufacture and to sell, and also by her determination to get down to national brass tacks and live nationally within her means.

Floating a great national loan is all right for exceptional and pressing circumstances, but it cannot be continued. It would simply mean tying an additional financial millstone around our national neck every year, until we had defied the laws of strength and resistance to such an extent that the whole superstructure toppled over.

If you are going to live in this country, you have got to look at the future of this country in a big way. If not it will be doing the country a kindness if you get out.

Canadians must realize now that the hurrahs of the Victory Loan have subsided, that with this accomplishment they have taken on a very serious responsibility. The people of Canada owe themselves millions upon millions of dollars, and it is the people of the Dominion who have to pay this money back to themselves. That may be a homely way of stating the case, but it is the view that should be brought home to the people now, from the apprentice right on through to the president and the general manager.

Always in the Student Period

HAVE you stopped your studies? Have you gone ahead very far since you passed from the apprentice or improver stage to that of the full-fledged journeyman? Has anything grown except your pay envelope and the cost of living?

There's many a man who has made the fatal mistake of stopping just when he was getting into a good stride. There's a lot of them who have gone in on some switch with a blind end, and a car shunter to stop them from going any farther.

Never be too old or too busy to learn. If there were things you missed during your apprenticeship, get after them now whenever the opportunity comes to do so. Do not, for instance, if you are a man on the machine or the bench, imagine that drafting is good only for the man in the drafting office.

Writing to CANADIAN MACHINERY a few days ago, Mr. A. M. Lount, master mechanic of the Massey-Harris Co., Toronto, brought this point out in speaking of the drafting course that is running in this paper:—

"In comment of the same, would say that the writer has found several of his men are following this course, and is very pleased with the idea, but would suggest that some little article might be prepared which would call attention strongly to the point that a course of this nature is particularly valuable to the man on the machine or the bench just as much as it is to the beginner in the drawing office.

"With reference to the course itself, would say that so far it appears to have been very cleverly designed, and is just about the thing that is needed."

Never try to get in behind the excuse that you never had a chance when you were a boy. Do not rehash that yarn about having to leave school early and go to work. Thousands have had to do that, and from these thousands many have gone ahead in spite of conditions, rather than with their assistance. What others have done you can do. In fact the same words that appeared in this page last week can well be used again, "You can make yourself what you want to be."

A COMMA is a little thing, but so is a cinder in your eye. In the wrong place, little things can cause a great deal of trouble. A certain poor woman, whose husband was going to sea, handed through the clerk to the minister this notice, which she desired him to read in church: "A man going to sea, his wife desires the prayers of the congregation." The minister, punctuating it in his own way, read it thus—to the obvious amusement of his flock: "A man going to see his wife, desires the prayers of the congregation."

WIRELESS AT THE RATE OF 200 WORDS A MINUTE

Remarkable Developments Have Taken Place — Messages Sent Over 12,000 Miles

AT a recent meeting of the Montreal branch of the Engineering Institute of Canada, a paper on "Recent Progress in Wireless Telegraphy" was the subject of the evening, and the speaker was J. O. G. Cann, chief engineer of the Marconi Wireless Company of Canada, in Montreal. During the address Mr. Cann spoke on the widespread use of wireless by the Germans and the enterprise of the British and other allies in the destruction of many stations in various parts of the world that had been utilized for enemy war purposes. Mr. Cann outlined the different systems now in use, describing briefly the operation of each, stating that the spark method of the Marconi Company was the one generally used throughout the world. Some conception of the efficiency of wireless may be gathered from the fact that signals from Carnarvon, in Wales, have been regularly copied at Sydney, Australia, a distance of 12,000 miles. Mr. Cann read two of these messages that had been transmitted during the period of the war.

Wonderful advancement has also been made in wireless telephony, and sets are now available which will permit of telephonic speech from one airship to another, or from the plane to the ground. Sets are also made for conversation between ship and ship. Mr. Cann also spoke on the progress of direction finding and the advantages that had been derived by its use in minimizing or eliminating many of the Zeppelin raids over France and England. This feature was also extensively used in locating enemy submarines and subsequently destroying them. Some idea of the progress of wireless may be had in the speed that is now possible in transmitting messages. The hand-sending method, with a speed of about 20 words per minute, is being replaced by apparatus with a capacity of over 100 words per minute, and special machines are now under construction, at Montreal, that will be capable of transmitting 200 words per minute. Signals from this new device will be transferred direct to the land circuit and from there taken off on a tape passing through a printing telegraph. Samples of these messages were on exhibit, and it is interesting to state that one of these was recorded when the operator was absent from the office. In addition to the address, Mr. Cann had with him some modern wireless equipment, and illustrated with a number of slides, some of the essential mechanism of a wireless station.

Men and Machines

A WELL-KNOWN Canadian firm, advertising its lines, uses the phrase, "If you can't get the men, get the machines."

There is something more than a mere catch phrase for selling in that statement. It tells an industrial necessity in a blunt and forceful way.

There are foundries filled with moulding machines to-day, partly because they refused to be strike-tied, and because the competition the firm had to meet called for production the most efficient way.

There are special purpose machines lined up in production departments all over the country to-day working on operations that a few years ago were considered as grist for a standard or general purpose machine.

The whole atmosphere of the mechanical world is changing. When our forefathers wanted nails they went to the blacksmith shop and the smithy hammered them out. To-day nails come out so rapidly that it keeps a man busy carting them away.

Likewise when in need of clothing they sheared the flock, and laboriously spun the wool to yarn to cloth. To-day ponderous and intricate textile machinery performs the same operations with so much more rapidity and precision that the old process seems unthinkably slow and cumbersome.

Not many years ago the compositor in the printing office set type, one letter at a time. They used to attain what was reckoned as speed in those days, but to-day one operator fingering a keyboard, will readily produce five times as much type.

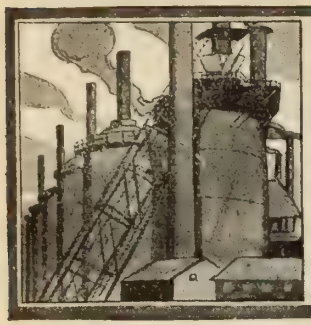
Such great strides have been made in the past that we, at times, may be inclined to think that mechanical progress belongs to the past. That's wrong. New machines are coming out now. There are more reasons than ever before. There is the element of absolute necessity. Firms must put in labor-saving machines or go down and out in the pace of active and unrelenting opposition. If they can't get the men they must get the machines.

French Names For Tools and Machines

THE Assistant to the Commissioner-General in Paris writes under date of October 10: When Canadian manufacturers are writing to customers in France it is well to use, so far as possible, the nomenclature current in the trade in France. Following are translations of the French names of some of the tools and machines in demand in France:—

Machines-outils.	Machine tools.
1. Alésoirs	Reamers.
2. Appareils de levage	Lifting machinery.
3. Boulons	Bolts.
4. Chaines de sureté	Safety chains.
5. Cisailles	Shearing machines.
6. Coussinet	Bearing.
7. Coussinets a billes	Ball bearings.
8. Coussinets de filière	Cutters (screw plate).
9. Crochets	Hooks
10. Ecrous	Nuts.
11. Etaux limeurs	Shaping machines or shapers.
12. Filières	(Screw plates) making (Threading plates)thread on bolt.
13. Forets	Drills.
14. Fraises	Milling cutter
15. Fraiseuses	Milling machines.
16. Grues	Cranes.
17. Machines a affuter les outils	Tool grinders.
18. Machine a fraiser	Milling machine.
19. Machines a meuler	Grinders.
20. Machines a meuler a meule émeri	Emery grinders.
21. Machines a outil pour chemins de fer	Railroad machine tools.
22. Machines a polir	Polishing machines.
23. Machines a rectifier	Precision grinding machines.
24. Machines a tarauder les tubes	Pipe threading machine.
25. Machines a laminer	Rolling mills machinery.
26. Machines de toleries et chaudronneries	Boilermaking machinery.
27. Machines d'extraction	Excavating machines.
28. Mèches	Bits.
29. Mèches pour percer le bois	Auger bits.
30. Mortaiseuses	Slotting machines.
31. Perceuses	Boring machines.
32. Poinconneuses	Punching machines.
33. Cisailles poinconneuses	Punching shears.
34. Raboteuses	Planing machines or planers.
35. Robinets	Valves.
35a. Scies a métaux	Metal saws.
36. Tampons	Buffers.
37. Taraudeur	Threading.
38. Tarauds	Taps (making thread in nut).
39. Tendeurs	Layers.
40. Tours	Lathes.
41. Tours a fileter	Thread-cutting lathes.
42. Tours automatiques	Automatic lathes.
43. Tours verticaux	Vertical lathes.
44. Treuils	Windlass.
45. Tube	Pipe.

Canadian firms desiring to sell any of the above articles in France may write for information to the Commissioner-General for Canada in France, 17-19 Boulevard des Capucines, Paris, France.



MARKET DEVELOPMENTS

High Premiums Being Offered for Auto Sheets

Strike Conditions Still Exert a Very Marked Effect on the Markets —Hard to Satisfy the Customer Who Wants to Secure a Quick Delivery in the Tool Market

WHILE it is a fact that the larger producers of steel are adhering to their old prices, that does not speak for the jobbers and the premium mills. Sales that are made now in sheets, plates, etc., are on the merits and urgency of the case. It is reported that in some points where makers of automobile bodies are hard up for supplies they are offering premiums as high as $30 per ton in excess of the regular price to secure the wanted metal.

Fortunately for the shipbuilding industry in this section a nice tonnage has arrived during the week. This was placed on the books some time ago, but it has been rolled in the strike zone since the strike was called. Some of the producers' books are becoming rather top-heavy with future business, and it would cause no surprise were some of them who do considerable booking in Canada to announce that they are out of the market for the time, especially on bars and hoop steel. There are warehouses in this district that have not seen a shipment of sheet or plate for almost a month now, and their customers are not faring any better.

The market for machine tools remains satisfactory. There is a good volume of business passing, the only trouble being in looking after the man who wants an immediate delivery. His only recourse for the time being is in turning to the used machinery market.

Improvement is seen in the scrap metal market, there being increased prices offered for stove plate and No. 1 machinery scrap. The coming of Baldwin's Limited to Toronto will mean that there will be a large purchaser in that firm for scrap material, as they will operate their electric furnaces largely from scrap.

MONTREAL DEALERS HARD UP FOR SOME WAREHOUSE LINES

Special to CANADIAN MACHINERY.

MONTREAL, Nov. 20.—There is still considerable pressure required in obtaining shipments of steel commodities from the United States mills. Dealers here, so far, have not been pinched for supplies, but have experienced no little difficulty in securing certain lines from American producers. The lines most affected have been plates, tubes and sheets, the latter in particular being almost impossible to get, especially for stock. With the coal miners gradually going back to work and the steel mills slowly coming back to normal operation, dealers here anticipate an early resumption to regular business. Some of the steel producing centres in the States have experienced considerable difficulty in securing raw materials and operations have been interfered with, but late reports indicate a better condition. However, the situation is not yet one that would change the mind of a pessimist, but is, nevertheless, moving toward a satisfactory adjustment. Dealers here are watching the developments across the line, and while reluctant to meet the advances that have taken place on some lines, there is a possibility that advances on some of the semi-finished materials will be found necessary. General trading continues normal in those lines when the warehouse can supply the material.

The inquiry for machine tools is still of an encouraging character, but the situation in the States prevents dealers from stating when delivery of tools can be made. Dealers of old material report a gradual improvement in steel requirements.

Coppers Down and Others Up

Apart from the strength that is noted in price quotations the market is relatively unchanged. A steady business is carried on in all of the metals, but is not of large volume. With the exception of coppers, which are easier, and spelter and aluminum, which are unchanged, the stronger tone of the American market has resulted in dealers here advancing prices. Lake copper at 24¾ cents is lower by ¼ cent. Electro is down ½ cent at 24 cents. Castings has declined 1 cent to 23½ cents per lb. Tin is ½ cent higher at 58½ cents. Lead has advanced ¼ cent to 8 cents per lb. Antimony at 10½ cents shows an advance of ½ cent per lb.

Fair Movement in Tools

From the reports that are gathered from the dealers and the trade, it is apparent that a fairly active demand still prevails for all lines of machine tool equipment. Inquiry seems to prove that the requirements are of a general character, and although few large single sales are recorded, the aggregate business compares favorably with that of the past few months. The situation as regards the delivery of tools from American manufacturers shows little change, and the delayed receipt of machines from United States points continues to be a factor of present trading. Dealers are reporting a good business in used machinery, but intimate that the visible movement of munitions machinery is considerably less and the second-hand trading is showing an increasing decline in this direction. One large tool dealer here has been overhauling used tools for the past 8 months, and equipment purchased on this basis is virtually rebuilt before it is offered for resale, so that the buyer is assured of a first-class tool when a sale is made. It has been learned that the Belgian Government has an option on a large portion of American tools now in Canadian plants that are the property of the American Government.

Strength in Steel Scraps

While there is little of a feature character in the local scrap situation, there is, nevertheless, a slight improvement in some directions. Non-ferrous metals are steady, but not active, and the demand is normal, with promise of gradual betterment. Dealers state that a better tone is developing in the steel end, as the past week has seen heavier trading than for some time. On the whole, the market is still quiet, but the better inquiry denotes increased buying in the near future. American mills are again in the market and shipments from this district are again in evidence. Steel foundries and stove plants are fairly busy and strength is also noted in general foundry requirements. Machine shop turnings are now quoted at $7.00, an advance of $1 per ton. Stove plate has jumped from $15.00 to $21.00, the price now ruling. Cast iron borings at $9.00 is an advance of $2.00 per ton.

SHIPMENTS OF STEEL BADLY NEEDED IN THIS DISTRICT NOW

TORONTO.—The fact that the coal strike has been called off in United States does not mean that there is going to be a good supply coming to this country. There are many firms who would like more definite information regarding their fuel stores, and it tends to create a little uncertainty in spots. The steel strike in United States, while it may be over in many of the plants, is still a very real thing in this country, because supplies are still seriously interfered with and curtailment of operation is resulting.

The Machinery Market

If one had told you, at the close of the war, that the Canadian market for machine tools was good enough to absorb thousands of dollars' worth of business every week for an unlimited time, there might have been some doubt in accepting the statement. But that is what has happened and is happening. The reports from dealers are all the same. The business offering is good, and the only fly in the ointment at the present moment is trying to look after the chap who wants to get a quick delivery on his purchases. The only dealers who can look after this sort of business very successfully are those with stock or used tools, and the former—stock—is not a plentiful thing.

Machine tool firms are making a study of the selling problems as they have not done for some years back, and they are going to put a lot more steam into the business in certain lines. They aim to make their representatives in smaller centres real salesmen. Doing this will save a lot of running around on the part of men from the head office.

Some Shipments of Steel

Conditions do not improve in regard to the amount of plate and sheets entering Canada. Fortunately some of the industries have had their business on the books of the steel companies for some time back, and now shipments against these previous orders are starting to come through and they really stand the firms in good stead, as otherwise they would have to close down entirely or curtail their output to a very large extent. The larger steel companies, such as the Steel Corporation, stick to the price that was in force when the strike broke out, and they are not going to change that as $30 per ton premium for auto material. It is only a matter of time, if things keep up there as they have been for the present at least. But of course that does not govern all the mills nor does it have much to do with the jobbers who are fortunate enough to secure a supply of material. Premiums are paid on all sides, and any material that may be had is based on the merits of the particular case as far as price is concerned. Reports from some points in the United States have it that automobile makers are now paying as high for the past month or so, before some of the agents for the large U. S. mills will have to go out of the market in certain lines, as their bookings are getting to be so far in advance that they become unsatisfactory and uncertain. The lines that will be affected by this move will probably be bars and hoop steel, for both of which there is a great demand and a correspondingly great scarcity.

Fortunately some of the shipbuilding concerns have a nice tonnage coming through at present, quite a lot of which arrived during the week. This business has been on the books for some weeks, but it has all been rolled since the strike has been on at the mills. They have received their material in good rotation, that is the keels have come along in good time in advance of the rest, so that work has not been retarded.

Warehouses in many departments are pretty well stripped of material. A shipment of sheets or plate would look wonderfully good to a number of such institutions. Their customers are also hard up, as far as being able to secure anything, and time does not improve matters. The season has been exceptionally favorable for rushing along material for outside work, and transportation has also been the best. The regret expressed on many sides is that in the face of these favorable circumstances, there should be happenings of such a disappointing nature.

A Better Scrap Market

For the first time in some weeks local dealers in scrap metals are willing to pay better figures for some of the whites. Stove plate, for instance, has advances from $13 to $18 per ton, while No. 1 machinery scrap is up from $18 to $22 per ton. The reason is that there is an acute shortage. Grey iron foundries are buying, and so are the markers of stoves and light sand castings. There is only a very limited supply coming in. This class of material comes mostly from the run of scrap heaps all over the country. The demand is just as keen in United States as here, and in many places more so. The demand is not unusual, especially at this season of the year. During the war nearly all the available material of this sort is gathered up and melted, and there has not been a very great deal of it coming into the market since.

Coppers are fairly strong and the same may be said of the brass sections. There is nothing coming across from the Old Country and nothing going out as freight rates are prohibitive.

There is considerable interest being taken in the coming of the well-known Welsh firm, Baldwin's, Limited, to the

POINTS IN WEEK'S MARKETING NOTES

It is reported from some American points that automobile body makers are paying premiums as high as $30 per ton in addition to the market price for sheet material.

—

Owing to the tremendous 1920 bookings some of the larger producers may shortly withdraw from the market. This refers especially to bars and hooping, which are hard to secure now.

—

The scrap metal market is showing more strength. There is an acute shortage of stove plate and No. 1 machinery scrap, and prices for these sorts strengthened several dollars per ton during the week.

—

It is now almost a month since some of the Toronto warehouses received a shipment of either plate or sheets. Some of the shipbuilding firms that had orders in some months ago received nice deliveries during the week.

—

The U. S. Ordnance Board is asking Canadian machine tool dealers for a refund of profits charged on duty on machines coming to Canada. In some cases the dealer's money has been tied up for as long as six months, so they consider they are entitled to charge their profit on the total selling price of the machine, including the duty.

—

There is a brisk demand for machine tools, and selling is general—the only exception being that it is hard to satisfy the man who wants immediate delivery.

—

Baldwin's Ltd., purchasers of the British Forgings plant, intend to rush work on their finishing plant, and should secure production by July of next year. They will be in the market for large tonnages of scrap metal.

plant of British Forgings, where there is a very large capacity for electric steel production. For the present this plant will operate largely from scrap material, and so it is seen that they will be very large buyers of this material. Work is being rushed on the finishing mill there now, and when production is secured there will be a large tonnage of scrap moved to that yard daily.

U.S. MAKERS OF MACHINE TOOLS SOLD AHEAD FOR SEVERAL MONTHS

Special to CANADIAN MACHINERY.

NEW YORK, Nov. 20.—One of the largest buyers of machine tools in the past week is the General Electric Co., Schenectady, N.Y., whose purchases have totalled about 100 machines. Another list calling for quotations on about 25 tools has also been issued by this company. Other companies which are buying or enquiring for equipment are the Worthington Pump and Machinery Corporation, N.Y.; the Bartlett Hayward Co., Baltimore, Md.; the Autocar Co., Ardmore, Pa.; the Lamb Knitting Machine Co., Chicopee Falls, Mass.; the National Scale Co., Chicopee Falls, Mass., and the American Locomotive Co., N.Y.

There is a slightly better demand for cranes, two large enquiries being in the market, one from the Bethlehem Steel Co., calling for bids on eleven cranes for its Lebanon, Pa., plant, and the other from the Sun Shipbuilding Co. asking for bids on five cranes for its shipyard at Chester, Pa., which will be enlarged by the addition of two ways.

The United States Shipping Board has cancelled a number of contracts with shipbuilding companies which took contracts during the war, and some of these companies are engaging in private work, with the result that a much improved demand for machine tools and plate-working machines from shipyards has developed. For more than a year builders of equipment have been waiting for a settlement of claims aggregating $650,000 against the Atlantic Corporation, Portsmouth, N.H., which built a shipyard at the behest of the Shipping Board during the war. No ships were constructed, however, because of differences which arose between the company and the Shipping Board relative to the contract. Now the Government has agreed to pay all claims, and the shipbuilding company will proceed on a new contract.

There is a good demand for second-hand tools because of delays in deliveries of new tools. The demand for new milling machines has been particularly good for some months, with the result that the milling machine manufacturers are well sold up. One large company will, however, soon increase its production to 500 milling machines a month and expects to be able to deliver machines from stock at all times. The country has absorbed a large amount of new machinery since the first of the year in addition to very large numbers of used tools from war plants. One large machine-tool concern had early in the year about $1,500,000 worth of its machines in stock, but now this stock has been entirely exhausted, in addition to all the machines that have been made since that time.

AUTO MAKER OFFERS PREMIUM OF $30 TON FOR BODY MATERIAL

Special to CANADIAN MACHINERY.

PITTSBURGH, Nov. 19.—Few union coal miners have returned to work since the officials of the United Mine Workers recalled their strike order under compulsion of the Federal court, but the steel industry is no longer seriously concerned since it is regarded as settled that enough coal will be mined to enable consumers to get along. There are stocks of coal of considerable magnitude, and there is heavy production at the non-union mines, this including the whole Connellsville district, which ships as much coal now as it makes into coke. Coal which the railroads have held instead of delivering it to consignees is likely to be released as occasion requires.

Steel Strike End in Sight

The virtual end of the steel strike is in sight. The strike is now in its ninth week, and in the past three weeks men have been returning to work more and more rapidly in all but one of the affected districts that remain, the exception being the Wheeling district, which remains tightly closed. Operations are increasing rapidly in the Mahoning valley, more than 50 per cent. of the blast furnace capacity being in operation, against about 90 per cent. just before the strike, while in Eastern Pennsylvania nearly as good a proportion. The Chicago-Gary district is rapidly approaching normal, while at Cleveland and Buffalo operations are increasing at a good rate. Western Pennsylvania has been practically free from strike for several weeks except in two spots, New Kensington and Monessen. The entire south has been running full throughout the strike, while in Eastern Pennsylvania the same is true with two or three trifling exceptions.

Supplies of Steel

Of course the steel market presents some appearance of there being a great shortage. Consumers are paying premiums for early deliveries of several descriptions of finished steel, and some buyers, particularly foreign buyers, find it almost impossible to make any purchases. The United States Steel Products Company, the export organization of the Steel Corporation, withdrew from the export market about a fortnight ago, and since then the Consolidated Steel Company, the company formed under the Webb Act and representing almost all the large independents, has likewise withdrawn from the export market. One of the large automobile makers is reported to have offered $30 a ton premium for steel sheets for bodies. Sales of black sheets on the basis of $4.50 to $4.65 for 28 gauge, or $2 to $5 a ton premium, have been common. Bars, which are officially 2.35c have readily brought 2.50c and more.

Making a general survey of the situation, however, and counting up the tonnage sought to be bought in proportion to the tonnage being produced, there is no wide scarcity of steel products. It is rather a small scarcity, very acute where it exists at all. In other words, a close estimate can be made that from the date of the strike, September 22, to date, the production of finished rolled steel has been between 2,000,000 and 2,500,000 gross tons less than it would have been if the rate of production in the first three weeks of September had been continued, and there is no dmand in the market for anything like such a tonnage of steel.

It does not follow by any means, however, that steel would have become a drug on the market if no strike had occurred. Jobbers and consumers had stocks, partly normal stocks and partly stocks built up in anticipation of a strike, for it must be understood that this strike, perhaps a much greater one than occurred, was expected, though nothing was said publicly about it beforehand by either manufacturers or consumers. Furthermore, the existence of the strike has caused many who would otherwise have been in the market to hold back, this applying particularly to those who had building projects. Finally, the strike occurred at the best time of year for producers and consumers in many lines. Thus the canning season was over and mill shipments of wire products for the usual fall distribution were ended. The pressure for deliveries of automobiles had begun to ease off, and the best time of the year for the inception of building operations had passed.

The strike, as a strike, will probably be practically over in two or three weeks, except possibly for the Wheeling district, but steel production will be restricted for a long time to come, through working forces being so disorganized. There will be after the strike, as there was before the strike, labor shortage, and there will be a desire on the part of the manufacturers to establish an eight-hour turn in place of the present twelve-hour turn, something that would require many more men if the entire mill and furnace capacity were to be operated.

With stocks exhausted all along the

line and with various industries requiring much more steel in spring than in winter, and with the railroads likely to enter the market after their long absence, there is bound to be a very heavy demand for steel, a demand greater than can be supplied. The lucky consumers are those who are recognized regular customers of those large mills that are adhering to the March 21 schedule of prices and are willing to book their customers for additional tonnages, for 1920, as shipments are made on their present contracts. The casual buyer, or the buyer who has been in the habit of shopping around among mills seeking the most favorable turns and buying now from one mill and now from another, has practically no chance in the market at present, and is not likely to have much chance for months to come.

Many of the smaller independent mills have advanced prices. This means in substance that they are charging delivery premiums, as long as there are other sellers who will take business from old customers at March 21 prices. To what extent the large independents will do the latter is not known, but what the Steel Corporation has done is shown in its unfilled tonnage statement for October, made public last week. This statement showed unfilled obligations at the end of October of 6,473,668 tons, representing an increase of 188,030 tons during October. As the Corporation's shipments in October were between 700,000 and 800,000 tons, probably close to the latter, its bookings in the month were nearly a million tons, and it is positively certain that none of this business was done at above the March 21 prices.

Except to an extent in Bessemer and basic iron there is no restraining influence in pig iron as there is in steel, and foundry pig iron continues to advance apace. A prominent merchant firm which buys and sells pig iron and also acts as agent, calls the valley market on foundry iron $34 at furnace for silicon 1.75 to 2.25 per cent. and $26 for silicon 2.25 to 2.75 per cent., with malleable at $33. The The $34 compares with $26.75 for the same kind of iron by the March 21 schedule. A prominent producing interest calls basic iron $27.25, valley, and Bessemer $28.50, but one would have to be a customer of long standing, no doubt, to be able to buy at such prices.

The prices for foundry and malleable quoted above are, it is true, for early deliveries, and thus they might be considered premium prices, for delivery, were it not that there are no sellers for extended delivery and it is difficult to call a price a premium price when it cannot be stated over what price it is a premium. It appears to be a case of team work among the furnaces, to get a prompt market established and then endeavor to sell for extended delivery at the same prices.

New York.—Practically every grade of scrap is in active demand, and prices are moving upward. Heaving melting is moving freely at $16.50 to $17 f.o.b. New York. Clean cast borings are at $15 to $16.

CANADIAN MACHINE TOOL MEN ASKED TO REFUND PROFIT ON DUTY

MACHINERY dealers in Canada are particularly interested in a move that is being made now by the U. S. Ordnance Department, in the asking for a rebate of profits paid on the duty of the machines imported from United States for carrying on U. S. contracts in this country. For instance, suppose a machine cost $1,000 in United States, and the duty was 35 per cent. The dealers reckon the resale price of that outfit as $1,350, and collect their profits in proportion. The claim of the Ordnance Department now is that there should have been profit charged on only the price of the machine, and that dealers should refund the profit they collected on the duty.

"From our standpoint," stated one dealer to CANADIAN MACHINERY this week, "the thing amounts to this. We have always looked upon our selling price as the price laid down to the buyer here. If he sent to United States for that machine it would cost him $1,350. We admit there is a good talking point in it, but there are other considerations. If a buyer came in here and said to me, "The duty on that machine is going to be $350, I will give you a cheque for that the day it is called for by the customs," we would be pleased to call his purchase $1,000 and base our earnings on that. But there are many cases where we have our money tied up for six months, and we simply have to maintain our balance of profit, or else we could not stay in business. As far as we are concerned now the deals have all been closed up long ago. When United States contracts first came over here we were dealing directly with the Canadian contractors, but a short time after that the U. S. Ordnance Department notified us that in future dealings would be direct with them. As far as the dealers are concerned I do not see how they can do anything about it."

Asked if there would be much involved in the controversy, our informant stated that he believed the claim, were it allowed, would amount to a considerable sum, as practically all the machine tool dealers in Canada are affected by the claim now being put forward by the U. S. Ordnance Department.

CONFERENCE WEEK FOR C.F.M. PEOPLE

Two Gatherings Held, One of Them to Make Better Salesmen Out Of Dealers

The Canadian Fairbanks-Morse Co. held a dealers' conference at the Bloor Street plant on the 18th and 19th, and on the 21st and 22nd a department managers' and salesmen's conference at the offices on Front Street. About 75 dealers were in attendance at the dealers' conference, the idea being to make more efficient salesmen out of the dealers. Mr. F. W. Evans, the Toronto manager, addressed the men, pointing out that the successful dealer to-day must not depend on the company sending salesmen from the head office to close sales in their districts. A dealer must aim to become a salesman, not only to locate the prospective buyer of an engine, but to show him what kind of an engine and what equipment he needed. By so doing, the men attached to the sales force of the head office would have greater time at their disposal to develop new territory. Another point made by Mr. Evans was that the one sure way to enable Canada to regain her strong financial position was by greater production in this country, by having more things to sell, and a strong appeal was made to the dealers along these lines.

Pittsburgh.—All grades of scrap have advanced sharply this week. Heavy melting has been sold at $21.50, cast borings $20, and machine shop turnings $17 delivered. Iron axles have brought $40 and cast iron car wheels $29.

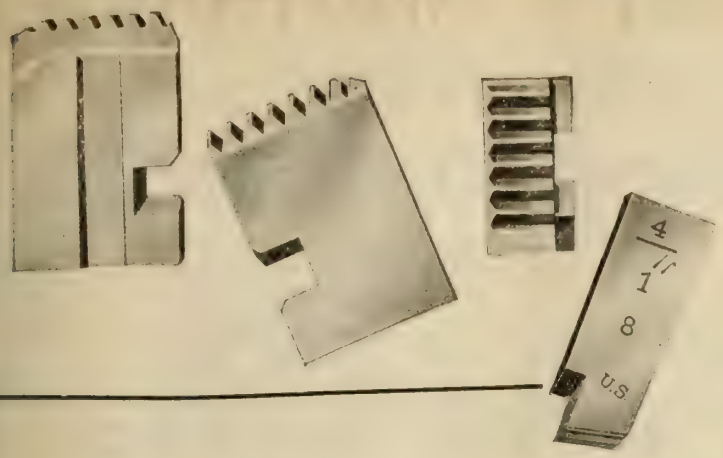
SARNIA PLANT MAKES A START

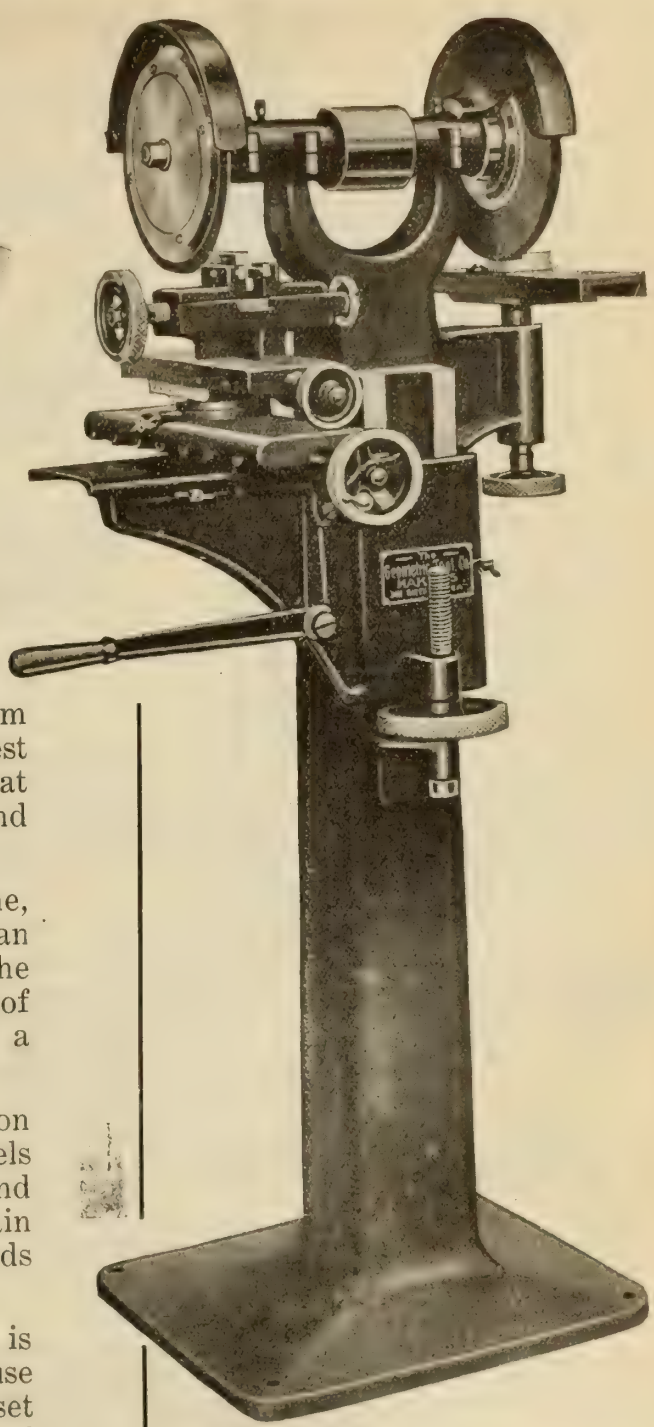
H. H. Robertson, Ltd., Turning Out Asbestos Protected Metals for Building Purposes

H. H. Robertson, Ltd., Sarnia, manufacturers of asbestos-protected metals for building purposes, are now operating their plant, the first of its kind in Canada. The building which they are occupying had to be remodelled in many respects to receive the necessary equipment. This process is one which renders absolutely weatherproof metal employed in the construction of practically any kind of factory or storage building. It has a wide use in the United States not only for manufacturing plants, mine buildings, elevators, power houses, etc., but has also been used satisfactorily on buildings in which fine architectural effect has been more or less of a factor. The management of the Sarnia plant intimates that the outlook for their product is exceptionally encouraging. A further development will be the manufacture of good roads material.

ERRATA

We stated in our Oct. 23rd issue that the Cincinnati Lathe and Tool Company of Oakley, Cincinnati, formerly made a 15-in. lathe. This was an error in the reading matter, for this company does not manufacture, nor never has manufactured a lathe of such size. They supply their machines in the following sizes: 16, 18, 20, 22, 24, 26 and 28 inch sizes, and in two-foot lengths of bed from six to thirty feet long, either cone type, belt drive, or geared head for belt or motor drive.





Sharp Chasers Cut Clean Threads

Accurate, uniform threads result only from dies which are maintained in the highest state of cutting efficiency. This means that chasers must be kept sharp, and ground uniformly.

Even if just touched up from time to time, the chasers respond splendidly, with clean threads. And with this machine — the Geometric Chaser Grinder—the matter of keeping threading tools up to scratch is a comparatively simple matter.

Various makes of chasers can be ground on this adaptable machine. The two wheels permit the easy grinding of both milled and tapped chasers. In addition, the plain wheel lends itself readily to various kinds of tool grinding.

Uniform grinding of a set of chasers is purely a mechanical matter through the use of adjustments which can be accurately set to govern the grinding of an entire set of chasers.

The Catalogue describing this machine is a mine of information on chaser grinding. Write for it

Complete Line of These Tools Always Carried in Stock

For almost forty years Starrett Tools have gauged the accuracy of the world's work. Micrometers, calipers, hack saws, tapes—whatever the tool, if it bears the Starrett trade mark, machinists recognize it as standard.

Every machine shop mechanic and owner knows Starrett Tools. Their superior merits need no recommendation, and when you are in need of anything in the Starrett line you can order it from AIKENHEAD'S with assurance of getting it quickly.

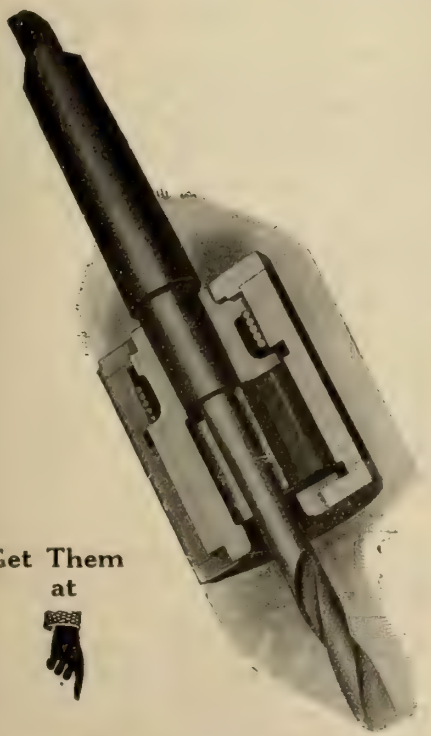
17 Temperance St., Toronto



Get Them at

WAHLSTROM Automatic Drill Chucks Save Time

You can remove the tool in a second without stopping the work. They are centred automatically. No slipping, no chewed-up shanks.

Your work often requires more spindles than your drill press possesses. The Wahlstrom Automatic enables you to drill any number of holes of various diameters, regardless of the number of spindles in your drill press, at a MINIMUM cost.

As we carry a full line of Wahlstrom Chucks in stock we are able to meet your requirements at a moment's notice. Remember AIKENHEAD'S when you need a Wahlstrom.

Announcement of Special Interest

to users of

Drop Forgings

THE Dominion Forge & Stamping Company have sold their two Stamping Plants.

This means that the entire resources and energies of the Company will be devoted to the Drop Forge Industry.

Extensive additions are being made to their Forge Plant to take care of the increasing demand for drop forgings in Canada.

This Plant is one of the largest and best equipped drop forge plants on the continent; and to maintain this position in the industry the company decided on this policy of concentration.

Forgings are made to customer's blue prints and specifications. Inquiries are solicited.

Dominion Forge & Stamping Co., Ltd.

Rushing Work on Baldwin's Finishing Mill

British Forgings Plant to be Greatly Enlarged—Expect to Operate Furnaces From Scrap Material—Operation Should be Secured at Toronto Plant by July of Next Year

TORONTO is in a fair way to take its first step toward becoming a centre of basic industries—or to be more correct, the step is being taken for her by Baldwin's, Limited, the Welsh tin plate manufacturers. Already progress is being made on the finishing plant that is being added to the British Forgings, and if present progress is maintained production should be secured by the middle of 1920. The new finishing shop, it may be mentioned, is 800 feet long by 70 feet across, and in this will be housed the rolling mills which will turn out the product that has heretofore been supplied from Wales, as far as the Baldwin business was concerned.

Speaking to a representative of CANADIAN MACHINERY this week, Mr. J. C. Davies, managing director of the company, stated that in coming to Canada, and locating in Toronto, he believed a business was being established that would have a great influence on the manufacturing industries in this community. "We want the support and the co-operation of the people of Toronto and the whole district. We are willing to establish here one of the heavy or basic industries, one that will turn out a large tonnage of material that is now imported. The securing of power is one of the chief items in our arrangements. We have not yet secured the arrangement we want, but there is not a great deal between ourselves and the Hydro Commission."

Something of the Plant

It might be well to mention here that the Baldwin plant has a capacity that will take care of 22,000 h.p. There are ten six-ton electric furnaces of the Heroult type. It is, as far as we know, the largest electric furnace installation of that type in the world, although there is one in course of erection in Norway or Sweden of equal, if not greater, capacity. The power comes to the plant at 13,200 volts, and for the purpose of carrying this line a duct run was laid across the city from Strachan avenue to Cherry, after which the line is overhead. Around the premises there are seven miles of standard gauge railway track. Shortly after the signing of the armistice the forge shop was destroyed by fire. For a time there was a fear in engineering circles that the plant was going to be dismantled. Mr. Russell, who had been representing the Baldwin interests in Canada for some time before, interested the principals of the concern to such an extent that in April some of them, including Mr. Davies, visited this country, with the result that after seeing the possibilities of trade in this country, and the capacity to which the plant could be developed, Mr. Davies opened negotiations, which have since resulted in the acquiring of the property.

No Blast Furnace Yet

The report has been published in some papers that Baldwin's, Limited, intend to work from the ore, which means the installation of blast furnaces and perhaps a coking plant. When asked regarding this, Mr. Davies said, "For the present we intend to operate the furnaces, depending largely on scrap metal, for the turning of which into steel ingots the works are admirably fitted. We will be purchasers of very large tonnages of scrap material, much of which I am given to understand goes out of the country at present. Our decision regarding the installation of furnaces later on to produce our own iron from the ore will depend on the development of the business and the conditions of the market. We believe that the operation of our plant here will be a good thing for numerous other industries, for there are many lines affected by the operation of a plant that is turning out tin plate, and our other lines. Above all else for the present, though, we want to secure the co-operation and good-will of the Canadian people. We want that more than anything. We are taking a big step in coming to Canada, for many of our friends urged us to keep on supplying the trade here from our Swansea plant in Wales. We have taken the big step and we certainly are not going to turn back now."

Production by July, 1920

"What will be the first lines you will turn out?" asked CANADIAN MACHINERY.

"We expect to put the finishing mill in operation, and then all lines can be turned out. Of course there is a great forging capacity at the works, as you know, that was utilized to such good advantage in war work. We shall likely use that to turn out some of the heavy castings for our rolling mill. Some of the rest of it we shall secure in United States and some will come from the Old Country. As far as we can see there should be easily a market now for 200,000 tons annually of tin plate, black sheets and black plate (black plate for enamel work), galvanized sheets, etc. We also intend to develop the forging plant."

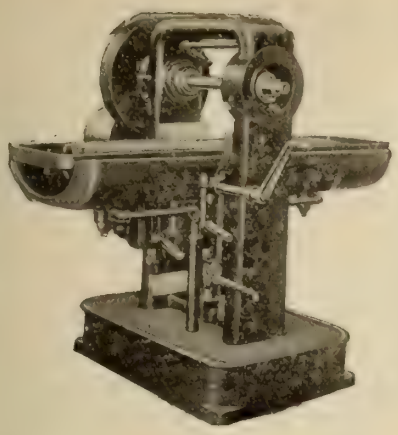
Mr. Davies is returning to the Old Country shortly, expecting to sail on the 25th of this month. He is enthusiastic about the future of this country, providing good relations can be maintained between the employers and labor. It is worth noting, in this respect, that the Baldwin plant, which employed at Swansea some fourteen or fifteen thousand hands, had no strikes during the war nor since, and good relations are maintained between the company and its men. It will be necessary for the Baldwin organization to bring to this country a number of skilled workmen, including those who will be in executive capacities. Their processes and methods must of necessity be followed very closely from the start if the best results are to be secured.

Roger Miller & Sons are putting in the foundation work for the finishing plant, and are making rapid progress. "If things keep moving as they are at present," said Mr. Davies in conclusion, "we should have production in several lines by July of next year."

SUCCESSFUL INDUSTRIAL CONCERNS GREW FROM SMALL BEGINNINGS

KITCHENER at the present time is hard put to it to accommodate the workmen who are flocking thither for employment in the city's factories or on construction work of the various plants now in process of erection. About one hundred and fifty houses have been built during the past season, and the Dominion Tire Co., by next spring, will have completed the erection of 300 houses for their employees. The manufacturers hope gradually to have the problem well in hand.

It is fairly well known that many of the large concerns now thriving in Kitchener had very modest beginnings. Discussing the unrest that is apparent among workingmen, and the persistent feeling that there should be some more generous division of profits, Mr. J. P. Scully, secretary of the Manufacturers' Association, Kitchener, said to CANADIAN MACHINERY: "When possible, and reasonable and advisable there will certainly be such a divison, but it is the privilege of every man to do just as many of our manufacturers did. The country is still young. The opportunity is there. Why not start in a small way and develop with the country? Let us look at some of our concerns. Here is one man who started in by making one or two articles at a time. Had no capital to speak of and had to sell as he went along in order to get the wherewithal to make a few more. To-day it's a large concern. There's another man who used to work for $1.75 a day on the railroad. To-day by hard work he is the head of a big industry. Another man and



BRIGGS-MILLERS

IN THE "HUDSON" PLANT

Many of the foremost manufacturing concerns of the country have learned that differentiating between Milling and "Briggs" Milling is a profitable departure. They've found that over a wide range of application "Briggs" means better work and more of it, greater economy and larger service. In the Hudson Motor Car Co.'s plant, Detroit, Mich., "Briggs" Millers are making a particularly fine showing, being used exclusively on many operations requiring the closest limitations. It'll pay you to investigate "Briggs" possibilities on your work.

his five sons toiled as no man ever did to develop a struggling industry. Dad and the boys stuck together—an unusual thing. To-day nobody will say they are not entitled to the fruits of success.

Still Another Example

'One of the largest and most successful shirt and collar concerns on this continent is located here and had a very small beginning. These things were not achieved by any six or eight-hour day process—not by "sudden flight, but by toiling upward in the night." And it is a fact that all of these men did toil upward both day and night. And the head of many a concern to-day is working and worrying for the welfare of his employees while the latter are sleeping."

The Kitchener citizen pointed out, however, that it is believed that in no other city in Canada was there a more sincere desire to give the workingman a square deal. Up to a short time ago, when certain trouble makers appeared on the scene, no employee seemed to find it necessary to ask for better wages or conditions—all were satisfied. When any subsequent protest had been made it had been given fair consideration."But the point we have to remember," said he, "is, that if Canada does not produce as she should, other countries will do so, the market will be supplied and Canadian industry will have fallen short. I believe as others do, that the Canadian future will be sure of big business."

The Week's Events in Montreal Industry

J. H. Barnes, who, for the past three years has been on the production staff of Darling Bros., Montreal, has been appointed purchasing agent for the company.

The American Smelting and Refining Company of Cincinnati, Ohio, are in the market to purchase large quantities of old materials, especially non-ferrous metals.

The Standard Equipment and Tool Works, 179 St. James St., Montreal, are in the market for a good universal milling machine, equivalent to No. 1 or No. 2; also a planer, shaper, and a bolt cutter.

The large dam recently constructed on the St. Maurice River will henceforth be known as the Gouin Dam. This enterprise is the largest of its kind in the world, and is capable of developing millions of hydro-electric horsepower.

Several large steel castings, weighing from 30 to 50 tons each, are being made at the Longue Point plant of the Canadian Steel Foundries for a 2,000-ton hydraulic press that will be erected at the Turcot works of the company for heavy flanging and bending in connection with their car construction.

An aftermath of the war was recently given to the residents of Quebec, when three scows laden with Lee-Enfield rifle cartridges were towed into the middle of the Rover St. Lawrence by order of the military authorities, and dumped into the water. The ammunition formed a large portion of the high surplus stock on hand, and for which there has been little need now that the range practice is discontinued.

J. R. Binning has been appointed manager of the Furness-Withy Company for Canada and Newfoundland. The appointment was made by Sir Frederick Lewis, Bart., the chairman of the company, during his recent visit to Canada. Mr. Binning has been with the shipping company since 1898, when he resigned from his position in the foreign freight department of the C.P.R. to join the Furness-Withy Company as assistant manager in Montreal, being appointed manager in 1903. Mr. Binning has been active in marine circles for many years and has been identified with the work of the Shipping Federation of Canada since its inception.

The Canadian Railway Board has announced an agreement that provides for wage increases and certain changes in working conditions for approximately 35,000 Caadian railway shopmen. Negotiations to this end have been carried on for the past six months, and the wage increases will be retroactive to May 1 last. Changes pertaining to regulation of working conditions will come into effect on December 1. The agreement was signed on behalf of the board by the chairman of its administration committee, Mr. Grant Hall, and for the employees by Messrs. R. J. Tallon, Frank McKenna, and Chas. Dickie, president, vice-president and secretary respectively, of the labor organization.

Continual development in the Canadian pulp and paper industry has been a feature of the past few years, and now we have the announcement that Price Bros. & Co. anticipate extensive expansion to their present activities. This firm has definitely decided to commence operations on a large newsprint mill in the Saguenay district, which, when completed, will have a capacity of over 400 tons per day. Additional equipment has already been installed at the Kenogami mill, so that the present output of Price Bros.' mills has been raised to 325 tons per day, of paper and board. When the new plant is operating, the capacity of the three mills will be about 800 tons per day. The advent of the new mill will mean a new town site, and it will bear the name of "Saguenay."

There is every reason to believe that Canada will participate, in a large measure, in the reconstruction work that will be carried out in Belgium. Senator Beaubien, director of the Canadian Car and Foundry Company, who has been in Belgium for some time past, negotiating with the Government there for the relief of transportation difficulties, expects favorable consideration of the project. Hon. Philippe Paradis, president of the Asbestos Manufacturing Company of Montreal, has also been in conference with Belgian and French officials, with the purpose of obtaining further contracts for cement products for use in reconstruction. Many other Canadian firms anticipate extensive trade development with Belgium. It is not unlikely that Belgian interests may establish a linen-weaving industry in Canada.

The plant of the National Electro Products Ltd., on Morreau Street, Montreal, is just about completed, and it is expected that active operations will be started before the New Year. In addition to the reconstruction of the plant that was acquired from the Beaver Engineering Company, a new building has been erected on the adjoining property that will give a total factory area of 100 by 100 feet, and situated directly opposite the C.N.R. freight sheds, which offers excellent shipping facilities for their product. Generating equipment has been installed for a capacity production of 60,000 cu. ft. of electrolytic oxygen per day. It has been learned that the company intend to establish a chain of factories from coast to coast; the Toronto plant is now in operation and the third factory will be erected in Hamilton. W. J. Cluff, of Toronto, is president of the company.

U.S. SCRAP METAL

Scrap prices are firmer all round. From all districts reports of better conditions are received. Following are some of the principal U. S. district reports:

Philadelphia.—There is a good demand for scrap, and purchasers cannot fill all their requirements. Borings and turnings are now being taken at the rate of 90,000 tons monthly. Rerolling rails sold at $28, and 1,000 tons of axles for export at $32 New York.

Boston.—Cast scrap stocks are being heavily drawn upon, and big advances are expected very shortly. Borings are very scarce, and some small lots have changed hands at $21 delivered. Heavy melting sold at $20.50 delivered.

Cincinnati.—With an improvement in the car situation, dealers have been able to ship material out, and all prices have advanced. All grades are in good demand, and conditions look better than for some time past.

TRADE GOSSIP

Making Changes.—Since November 1, all shipments made by Acme Stamping and Tool Works, Ltd., Allith Mfg. Co., and Safety Door Hanger Co., are being invoiced by Slater and Barnard Limited, who own and operate these three companies. All purchases made by any of these three companies will also be changed to Slater & Barnard Ltd.

Quebec.—It is stated that the Davey Shipbuilding Company, Lauzon, has obtained contracts for a number of vessels, which will keep the yard busy for some months to come. The National Shipbuilding Company, a newly formed concern, has taken over some old yards at Levis, and will commence on the construction of a number of vessels for which they have secured contracts.

Need for Care.—If Canadian factories are going to be kept running all winter, the utmost care in the consumption of steam coal will be necessary. Production in the United States is far from normal, and will likely remain so for some time. The amount of bituminous coal brought into Canada from April 1 to Oct. 31 was only 70 per cent. of the amount received in the same period last year, and none has been shipped in since November 1.

Engineers Wish to Close Ranks.—The Provincial Executive of the New Brunswick Association of Professional Engineers at a recent meeting held a discussion on the subject of the making engineering a closed profession. A bill will be presented to the Legislature at the next session, which will seek to prevent any civil, mechanical, electrical, mining or any engineer practising his profession in New Brunswick until he had established his qualifications and been registered according to the Act.

Yarmouth.—There have been two launches recently in this district, both of schooners. One was at Belliveau's Cove, where the three-masted schooner Rosanne Belliveau was launched, fully rigged and ready for sea. The second was at Meteghan River, where the Doucett Shipbuilding Company launched the tern schooner Celeste D. This latter vessel is fitted with a 15 h.p. Fairbanks-Morse oil engine for hoisting purposes. This can be applied to the hoisting of sails and anchors, and if necessary connected with the pumps.

British Firms First.—The Secretary of State for India made a statement recently on the subject of locomotives for the Indian Government. A scheme had been proposed by the Armstrong-Whitworth Co. whereby that firm would establish an Indian company for the purpose of manufacturing locomotives. The Indian Government in turn would engage to buy from the new firm one-third of the English boilers it requires. A counter proposition will be considered from the Locomotive Manufacturers' Association. No invitation has been sent to American firms to compete.

SALE OF MILITARY STORES, ETC.

DRY GOODS, HOSPITAL FURNITURE, BEDDING, HARDWARE, LEATHER GOODS, JUNK, ETC.

SALES WILL BE MADE BY SEALED TENDER

Persons desiring to tender are requested to register their names and addresses with the

SECRETARY OF THE WAR PURCHASING COMMISSION, BOOTH BUILDING, OTTAWA

stating the class of goods in which they are interested, whether new or second-hand or both.

Tender forms with full details of the goods and places at which samples may be seen, will be mailed when ready to those who have registered as requested above.

Special Terms to Hospitals, Etc.

Dominion, Provincial, and Municipal departments, hospitals, charitable, philanthropic, and similar institutions which are conducted for the benefit of the public and not for profit may purchase goods without tender at prices established by the War Purchasing Commission.

Returned Soldiers and Sailors and Widows and Dependents of Soldiers and Sailors killed in the War may obtain supplies, for their own personal use and not for re-sale, through the nearest branch of the Great War Veterans' Association who will combine individual orders and forward to the War Purchasing Commission through the Dominion Command of the Great War Veterans' Association. These services are rendered by the Great War Veterans' Association to all parties in the classes named, whether members of the Great War Veterans' Association or not.

All communiations should be addressed to the Secretary, War Purchasing Commission, Booth Building, Ottawa, who will be glad to supply lists and further details to those interested.

Ross Rifle Claim. — The Exchequer Court is to adjudicate upon the claim of Sir Charles Ross for compensation for the compulsory taking by the Government of the Ross rifle factory in 1916. Subsequent to the expropriation Sir Charles filed a claim for about $18,000,000 compensation and damages for cancellation of contracts. The Government refused the necessary fiat on the ground that in the order of expropriation the maximum value of the property was fixed at $3,000,000. On the latter basis the case now goes to the Exchequer Court to determine the actual amount to be paid with three millions as the outside limit.

Sale of Military Stores.—The War Purchasing Commission, Ottawa, is announcing a sale of military stores, etc., dry goods, hospital, furniture, bedding, hardware, leather goods, junk, etc., and inviting tenders for the same. Those desiring to tender are requested to register their names and addresses with the secretary of the War Purchasing Commission, Booth Building, Ottawa, stating the class of goods in which they are interested, new or used. Returned soldiers

and sailors and widows and dependents of soldiers and sailors may club together to obtain supplies for their own personal use by applying for particulars to the nearest branch of the G. W. V. A.

Trouble in Shipping.—The transportation department of the Canadian Manufacturers' Association is sending out the following circular: "Complaints recently received from manufacturers and shippers would indicate that the freight service on the L. C. L. shipments to points east of Montreal in Quebec and the Maritime Provinces is again falling down badly and we propose conducting a thorough investigation with a view to effecting an improvement. We shall be obliged, therefore, if you will advise as early as convenient if you have experienced any annoyance in this respect; and, if so, furnish us with full particulars. The information desired should include the following data: date of shipment; description of goods; consignee; destination, and, if possible, the carriers' way bill of reference, which you should be able to obtain from the local freight agent.

Busier at the Soo.—During the past few days there has been a great improvement in the industrial outlook at Sault Ste. Marie. It was announced that sufficient orders for rails and structural steel had been received by the Algoma Steel Company, a subsidiary of the Lake Superior Corporation, to keep the mill going all winter, or for six months. Several good orders for rails have been received lately from Canadian railways, being part of the work of replacement and repair so long delayed by the war. On October 21 the structural mill, recently completed as an addition to the rail mill, commenced operations, making structural shapes up to 15 inches, where formerly six inches had been the limit in Canada. Since then orders have been coming in rapidly. The manufacture of alloy steel for the first time in Canada has also been begun, and it is expected that this product will find its main market among the automobile factories of Ontario.

Sydney, N.S.—That better consideration would be given to the question of employment of returned soldiers, was the assurance given by Steel and Coal Company officials to E. R. Roberts of the advisory board of the G. W. V. A., Ottawa, and Dan McDougall, vice-president of the provincial command yesterday. A meeting between the above-named officers and Mr. McCann of the Steel Company and A. W. McDonald, employment agent, was held, and Mr. McDougall met a representative of the coal company. The many problems affecting the re-employment of returned men were thoroughly discussed. The delegation from the "Vets" were given a most attentive hearing, and they received the assurance that the returned man would be given every assistance to re-establish himself at the company's works. Mr. Roberts and Mr. McDougall both expressed themselves as extremely well pleased over the interview, and the promised betterment of conditions for their comrades.

PERSONAL

Walter Lambert, A.M.I.N.A., naval architect and marine surveyor, of Montreal, is leaving for Europe early in December to re-establish business connections with Old Country shipping interests, returning early in February.

The death is announced in Toronto of Capt. James McMaugh, who sailed the Lakes for upwards of fifty years. The deceased passed away at the home of his daughter, Mrs. D. R. McKenzie, 1307 King Street W. He was born in Quebec 78 years ago, and went to sea early in life. He was a veteran of the Fenian raid.

A. C. McKenzie has been appointed Engineer Maintenance of Way on the C. P. R., with headquarters at Montreal, succeeding Mr. Frank Lee, transferred.

Do right and you will fear no man.

Don't write and you will fear no woman.

PIG IRON TRADE

The pig iron market still is on the up grade. An added feature is that of basic, which is now figuring in the buying quite largely. Following are reports from U. S. points:

Philadelphia.—The market price for basic is now $33 furnace. The advance was sudden, the $6 jump occurring during the week. One lot of 20,000 tons was sold at $30, the next sale being at $33. Foundry iron is also higher, No. 2X selling at $35.50 Central Pennsylvania furnace.

Boston.—The scarcity of pig iron has turned New England buyers to Southern fields. Prices are higher, and there is considerable resale iron coming into the market. Sales for the week in Boston were around 6,000 tons.

New York.—There is not much tonnage available for this year's shipment, and prices are advancing with each sale almost. Next year sales are being confined to special customers of melters. There is good export enquiry but not much available.

Pittsburgh.—After a period of inactivity basic is getting into the procession. Quotations are being made for this year delivery from $27.70 to $29. Bessemer has been sold up to $29.50 valley furnace. Foundries are buying the steel-making grades to replace foundry grades that are unobtainable..

Buffalo. — Considerable tonnage on higher schedule announced some weeks ago has been sold this week. The prices are $34 for No. 2 plain; $35.25 for No. 2X and $37 for No. 1X. These prices are being generally quoted now. Malleable sold during the week at $33.

Cleveland.—Prompt iron is still very scarce and prices naturally high. Some Buffalo iron was sold at $36.10 delivered Cleveland. There is an enquiry in the market for 15,000 to 20,000 tons foundry and malleable for the General Motor Corporation; 1,000 tons 1.75 to 2.25 silicon foundry for first quarter delivery was sold at $31 to $32 Ohio furnace.

Chicago.—There are a number of enquiries out for foundry and malleable, but most of the makers are out of the market. There is some spot iron available from outside centres which is taken up as soon as offered.

Cincinnati.—Southern producers have withdrawn from the market on foundry iron. Malleable is in demand, and some has been sold at $34 valley furnace. There is little spot foundry iron to be got, and no iron is being offered for first half.

St. Louis.—First quarter iron is quoted at $30. Spot iron is in good demand, and $35 has been paid for Southern iron 1.75 to 2.25 silicon content. Foundries have enough business to keep them going for the remainder of the year.

AN INTERESTING BOOK

"One of the best things I have seen for some time," is the way one might describe the book issued by the Pangborn Corporation of Hagerstown, Md., descriptive of the works and the men behind the organization. In an introductory chapter is explained the manner in which Thomas W. Pangborn, fifteen years ago a salesman for foundry supplies, perfected his machines for sandblasting and successfully put them on the market. Subsequent pages show views of the plant and offices, and numerous products turned out at the plant, as well as a number of interesting installations at various plants.

THE "WANT" AD.

The "want ad." has grown from a little used force in business life into one of the great necessities of the present day.

Business men nowadays turn to the "want ad." as a matter of course for a hundred small services.

The "want ad." gets work for workers and workers for work.

It gets clerks for employers and finds employers for clerks. It brings together buyer and seller, and enables them to do business though they may be thousands of miles apart.

The "want ad." is the great force in the small affairs and incidents of daily life.

One of the things we all do well is to forget.

Names that were household words yesterday are gone to-day.

Because people knew your Name and your Line a year ago it is no sign they do to-day. They forget easily.

Keep yourself in the public mind by advertising. It is just as important to make old friends remember as it is to win new friends. Advertising does both.

A Little Act of Courtesy That is Good Business

BY simply mentioning CANADIAN MACHINERY when writing to our advertisers you will be doing something which will prove of three-fold benefit.

First—It will benefit you because it enables the advertiser to immediately associate your enquiry with the product advertised, resulting frequently in quicker service.

Second—It will benefit the advertiser because it enables him to identify and classify enquiries and to give credit where credit is due.

Third—It will benefit **your** paper because in the records of the advertiser it will receive the credit for your enquiry, instead, perhaps, of some less deserving medium.

We are always grateful for favors of this kind. It costs the reader nothing, and yet as we said before, it is of three-fold benefit.

"The Marshalltown Throatless Shears"

guarantee perfect work at less than half the ordinary expense.

Rotary, self-feeding shears designed for cutting in and out curves, straight or irregular shearing, circles, also beveling and splitting of plates. Built in various sizes having capacities from tin up to ½" thick. No limit to the size of sheet being cut. Hand, belt or motor drives. The last word in metal cutting shears. We also manufacture Rotary Bevel Shears, Splitting Shears and Plate Milling Machines.

Let us know your requirements.

Marshalltown Mfg. Co.
Marshalltown, Iowa

BECKER
BELT DRIVEN MILLERS

are machine shop necessities; they do work that formerly required planers, shapers, boring mills and other machine tools of this class, and do it quicker, better and cheaper than did the tools they displace.

The micrometer stop gauge, in the spindle head, enables the operator to work to thousandths. This is a distinct advantage, because it eliminates the possibility of spoilage in setting-up.

Your next machine tool should be a Becker Belt-Driven Milling Machine. They are efficient.

Let us tell you more about them.

Six Post Readers in New Cabinet

FORMER Finance Minister Cashen, who, following the crisis which led to the resignation of Premier Lloyd, of Newfoundland, has been called upon to form a Ministry, has already selected nine members to act with him.

Six of these, including the Premier himself, have been regular readers of THE FINANCIAL POST for some time.

This does not only indicate the quality as well as the extent of our circulation, but indicates also that men who carry big responsibilities find THE POST of value to them. It indicates, therefore, the approval which is meeting the effort of our editors and the great importance and value of the business information to which subscribers have access through the columns of THE FINANCIAL POST.

When the Government of Newfoundland was recently arranging the flotation of a $5,000,000 bond issue THE POST'S opinion as regards some methods of marketing was quoted by members of the Cabinet.

The Financial Post at Ottawa

IN the Dominion House of Commons the other week the attention of the Government was drawn to an article in THE FINANCIAL POST containing a reference to the financing of Roumanian orders through an agency established in London by Sir Clifford Sifton. Sir Thomas White mentioned that in reading his FINANCIAL POST that week, he had formed the opinion that the reference was to private marketing of bonds.

Keen Business Men and Cabinet Ministers Read the Post

SIR THOMAS WHITE, with other Cabinet Ministers and prominent Canadian men of affairs, have found THE FINANCIAL POST of swift and sure business service. When you "get down to business" you want the plain facts—all of them—without frills—and quickly. You get them like that in THE POST. THE FINANCIAL POST will keep you informed on Canadian business matters in a way unrivalled by any other publication. Send for a subscription to-day. The price is $3.00 per year, and you have only to fill in this form:

The MacLean Publishing Co.,
143-153 University Ave., Toronto.

Send me THE FINANCIAL POST every week till further ordered. I will pay subscription price, $3.00 per year, on receipt of bill, or you may draw on me for this.

Weight, pressure on the blade, is one of the biggest factors in getting everything out of a Hack Saw that the manufacturer put into it.

Too little weight is just as uneconomical as too much—and it doesn't have even the advantage of cutting quickly while the blade lasts.

Where too light pressure is used the teeth of the saw slip and slide over the work without cutting. If too much weight is put on, the saw may strip and, in any case, the teeth are worn off in a short space of time, out of all proportion to the work accomplished.

The surest, safest way to get Hack Saw economy is to use Starrett Blades according to the Starrett Hack Saw Chart. Both the blade and the method are sure to be correct if you follow the chart.

Send for Catalog No. 21"3."

CLINTON CEMENT

Did You Ever See Two Postage Stamps Stuck Back to Back?

Well, that's the way two bricks stick together when our cement is used.

The greatest loss in your furnace efficiency occurs as the result of leakage, cold air pouring in and interfering with proper combustion.

We Have Got This Licked!

Fireclay dries up and sifts out from between the bricks like powder.

But our cement sets and makes a surface like glass yet allowing for expansion and contraction. It sets hot or cold and stands a heat up to 3,000 degrees Fahrenheit.

This cement makes a joint that is stronger than the bricks themselves, and that is itself the strongest part of the whole furnace.

A five-pound tin of **Clinton Super-Heat Cement** will be sent to you free and all charges prepaid, if you write the

SMALLEY GENERAL THREAD MILLER

For Heavy Exacting Work

LABOR-SAVING, time-saving, waste-saving machines such as SMALLEY-GENERAL THREAD MILLERS offer the manufacturers the best solution of the problem of increased production costs.

The No. 1 Model illustrated above represents our latest achievement. This sturdy, powerful Miller is designed to do the heaviest and most exacting work. It will mill threads with **greater accuracy** and **speed** and at a **lower cost** than is possible by any other method.

One revolution of the work and the thread is milled.

For automobile parts, pipe fittings, flanges, oil and gas well supplies, in tool rooms and all kinds of commercial work, this machine will be found a **booster** of production and a **reducer** of costs.

Investigate the possibilities of the Smalley General Thread Miller in your shop. Full description upon request.

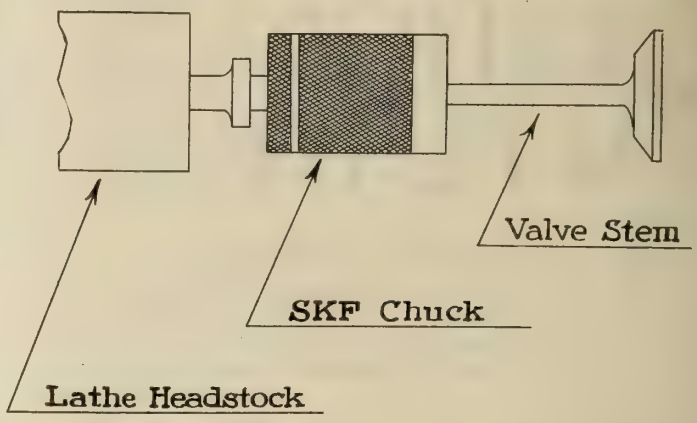
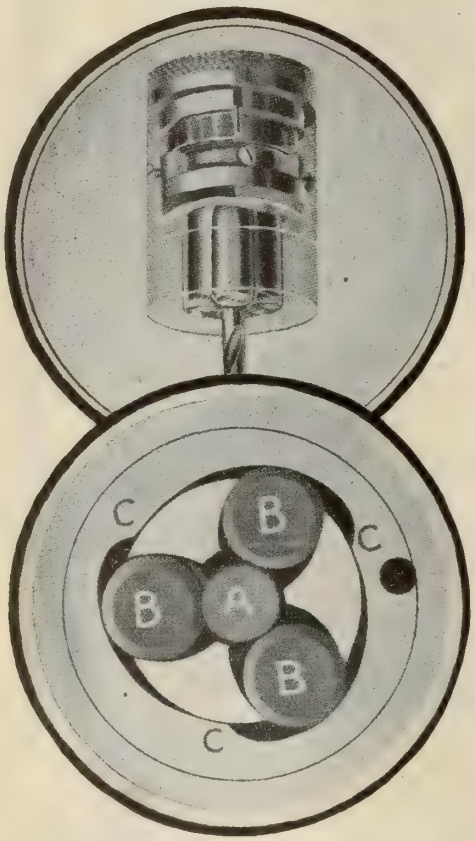
SKF AUTOMATIC-QUICK ACTING SELF-CENTERING DRILL CHUCKS

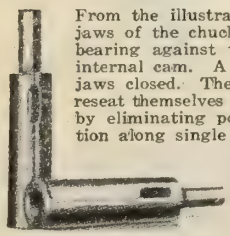
Suggestion No. 4 →

For Grinding and Polishing Valve Stems





A—*Drill Shank*
B—*Roller Jaws*
C—*Cam Surfaces*



Increase Size Range by using Adapters

From the illustration it will be seen that the jaws of the chuck are formed by three rollers bearing against the surfaces of a three-lobed internal cam. A coiled spring holds the roller jaws closed. The rollers are free to turn and reseat themselves with every drill release, thereby eliminating possibility of wear or indentation along single line of contact. The drilling resistance forces these rollers up the cam surfaces, causing them to close upon and grip the drill shank with a power always proportionate to the drilling stress, thereby precluding slipping of the drill under any conditions whatsoever.

No Saw-Edged Jaws to Injure Valve Stems in Grinding

JUST three smooth rollers, operating against an internal cam in the S K F Chuck, hold this delicate valve stem for grinding and polishing. The rollers grip just sufficiently to hold the stems, increasing their grip only and as the resistance caused by the polishing or grinding increases.

These automatic jaws are just one feature of the S K F Chuck, just as its use in grinding and polishing valve stems is only one of its many applications. The full story of the mechanical features of the S K F Chuck is contained in the new Chuck Booklet, and our engineering department will suggest special applications to meet your needs. Ask for both.

Quality Perfection in Cylindrical Grinding

The quality of the finish alone will determine the life of a motor. One imperfectly finished part may cause the failure of the whole mechanism; possibly with disastrous results.

LANDIS finished motor parts—valves, valve stems, pistons, piston pins, cranks, shafts and axles—are quality parts, accurate and reliable.

LANDIS cylindrical grinding machine output is very close to perfection. These machines possess all the refinements of thirty years of continuous development: they are accurate, powerful, and speedy producers.

Particular manufacturers have standardized on LANDIS finished parts.

LANDIS TOOL COMPANY

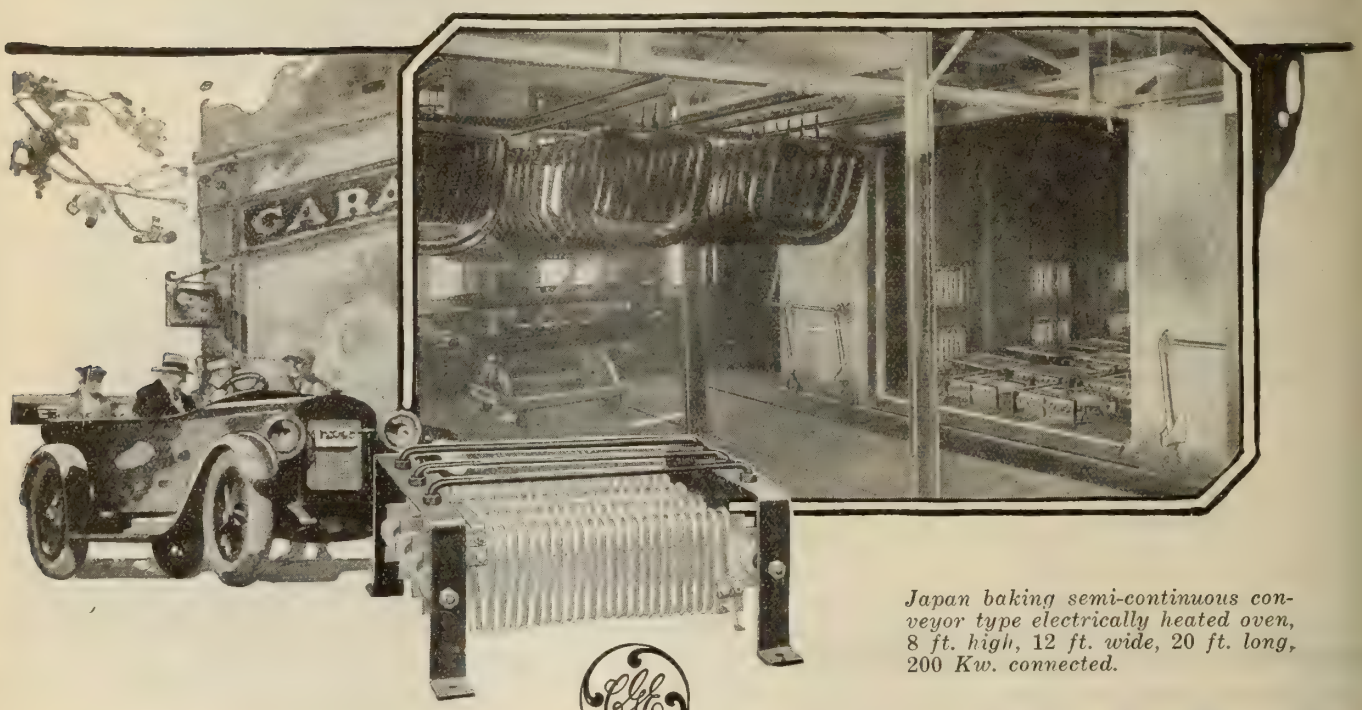
Chains—Keys and Cutters—Hand Milling Machines.

If interested tear out this page and place with letters to be answered.

The cheapest method of heating is that which reduces to a minimum the total cost of a satisfactory product.



Japan baking semi-continuous conveyor type electrically heated oven, 8 ft. high, 12 ft. wide, 20 ft. long, 200 Kw. connected.

Japan Baking the Modern Way

MANY of the principal manufacturers of automobiles have installed electrically heated ovens and in all cases great improvement in results has been realized.

Electricity can be used to supplant fuel in practically all heating operations and not only accomplishes better work, but more of it in a given time.

It has been repeatedly demonstrated that the installation of C.G.E. industrial heating equipment will effect many advantages, such as improved quality, increased production, saving in time, elimination of seconds, improved working conditions and reduced fire hazard.

The electric way is the modern way—the proven economical way.

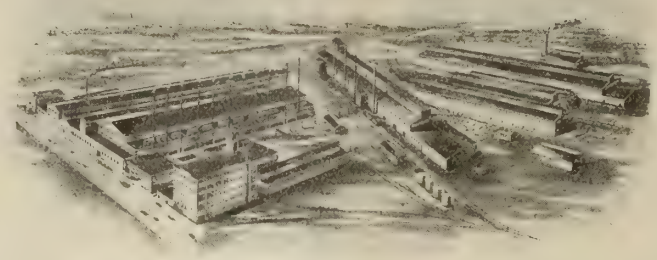
MESTA MACHINE CO.

Pittsburgh, Pa. U. S. A.

A Plant Equipped in Every Detail to Suit Your Every Need



STEEL PRODUCTS

Open Hearth, Basic and Acid, Electric and Alloy Steels.

CASTINGS

For Ships, Railways, Rolling Mills, Gears, Machinery and Ingots to 35 tons.

RAILWAY SPECIALTIES

Penn Couplers, Bolsters, Truck Side Frames, Draft Gears.

FORGINGS AND BILLETS

Heavy Ship Forgings, Locomotive and Car Axles, Miscellaneous Forgings.

PLATES

Plates and Heavy Sheets to 30 inches wide, Soft and High Carbon, Automobile Plates and Sheets.

AGRICULTURAL STEEL

Soft Centre and Solid Plow Steel, Harrow Discs, Shovel Steel, Cultivator Blades.

DOMINION FOUNDRIES AND STEEL, LIMITED
HAMILTON, CANADA

Type B
Guaranteed to 80,000 lb. pressure.

Speeds Up Tool-Making

Manhattan Screw Press

A great time-saver for the tool-maker, offers utility in the highest degree.

A one-man machine—tool-maker requires no help in handling the dies.

You should know more about it. Send for full details.

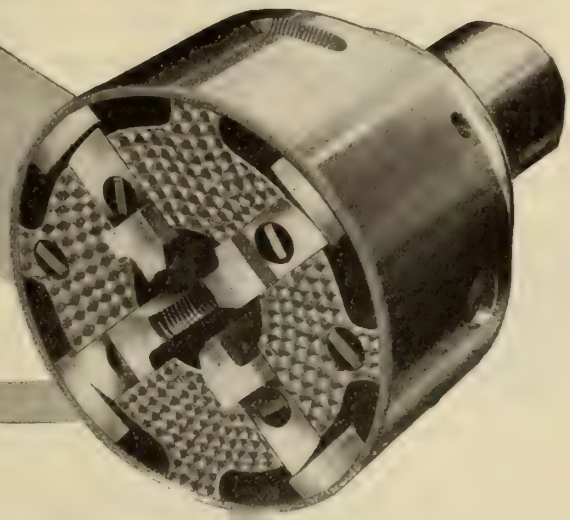
1½ MILLION PIECES

WITH ONE SET OF CHASERS IN A NAMCO DIE



In the Long Run—Averages Count

"The Chasers returned were used continuously for a period of better than 6 months and produced an average of 12,500 pieces in 22 hours, 5 days per week, thread .219"—36, ¼" long on Bottom Closing Plug American Time Fuse." (name on request)

This means not only a million and a half threads from one set of chasers,—it mean that the NAMCO Die Head which held the chasers opened and closed more than 3 million times on the one job, and it is still in operation.

Dosen't this justify our claim that after all, it's the simple design, correct materials and careful assembly in NAMCO Dies that have gained them the reputation of accurate and long lived threading equipment?

Figure it out for yourself. Catalog?

"MORSE"

WE HAVE LEARNED FROM LONG EXPERIENCE

THAT **IT PAYS** TO MAKE

RELIABLE TOOLS

"MORSE" REAMERS

are in the same class with all "Morse" Products.

Made from carefully selected stock, accurately cut, properly cleared, and have that lasting quality which characterizes all "Morse" Tools.

MORSE TWIST DRILL & MACH. CO.
New Bedford, Mass., U.S.A.

Cleveland Sand Rammers

FOR FLOOR, BENCH, PEIN AND FLASK RAMMING

Cleveland Sand Rammers are made in several sizes and weights, and are adapted for all kinds of Ramming in general foundry service.

The Piston Rods are packed with a resilient packing that conforms to the shape of Rod without retarding its free action, and prevents any dirt from entering piston chamber and working parts — Rammers are fitted with either Round or Flat Rods as required. Cleveland Rammers are light in weight, have high speed and practically no vibration, making them ideal foundry tools.

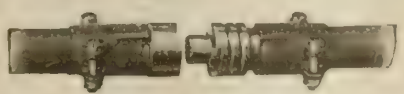
CLEVELAND CHIPPING HAMMERS

For General Foundry Work. Are furnished in any required size or weight for grey iron or steel castings; they have high speed, and are particularly adapted for fast chipping now required by piece-work operators.

BOWES AIR HOSE COUPLINGS

Standard Equipment Everywhere

Bowes Couplings are instantly connected or disconnected.



Bowes Couplings are absolutely air tight under all pressures.

Above cut shows the Never-Slip Clamp attached to Bowes Coupling.

In Stock:—RIVETING HAMMERS, DRILLS, REAMING, TAPPING AND FLUE-ROLLING MACHINES, CORNER DRILLS, PORTABLE AND BENCH GRINDERS, ETC.

Write for Bulletins, 34A, 41 and 43.

RALPH CONNOR

On "The New Canada and Its Needs"

RALPH CONNOR, the famous Canadian novelist, who served for several years at the front and saw the war from many angles, is convinced that Canada must be prepared to make important changes if she is to profit by the lessons of the war. He has written a series of articles embodying his views and calling vigorously on patriotic Canadians to awake to the needs of the hour. The articles, which deal with economic, social and Imperial topics, were written for MACLEAN'S MAGAZINE and the first appears in the November issue, under the title: "The New Canada and Its Needs."

Every Mother Who Lost a Son at the Front

will read with deepest feeling Nellie McClung's wonderful story, "Men and Money," which also appears in November MACLEAN'S. Mrs. McClung wrote this story with a purpose—to show the ease with which the world forgets the contribution these mothers made. But it is also a very fine story—real, human and gripping.

"The Idle Hands at Ottawa"

By J. K. MUNRO

The recent session of the Dominion House was in many respects an idle one. There was not a great deal done, so the members had a lot of time to stir up things, and the result was some hugely interesting political situations. All of which J. K. Munro tells about in his usual unsparing and tersely humorous way.

Remarkable Features of a Remarkable Number

The November MACLEAN'S is cram full of other big features—famous writers on vital subjects and everything Canadian. Look over this list:

Baroness Orczy—The author of "The Scarlet Pimpernel," best seller of best sellers, is represented by a serial story, "His Majesty's Well Beloved."

Robert W. Service.—The great poet of the Yukon and the battle front contributes a strong poem, "The Outlaw."

Basil King.—This great novelist who lives abroad contributes an interesting discussion on "Why I Remain a Canadian."

Janey Canuck.—An article on Mrs. Murphy's experiences as the first woman magistrate in the whole of Canada.

Camilla Kenyon.—A new novelist who promises to become a great favorite, tells a humorous story of adventure, and treasure, "Spanish Doubloons."

Stephen Leacock.—A humorous sketch entitled, "My Memories and Miseries as a School Master."

"Two Men and an Idea That Grew and Grew and Grew."—By Charles Christopher Jenkins.—A sketch of two remarkable and practically unknown Western millionaires.

"A Little Bit of Chicken Feed."—By Allen C. Shore.—A bright story combining love and business themes.

"The Rainbow Death."—By Madge Macbeth. An interesting detective story.

"The Search for Missing Men."—By Gertrude Arnold. An article on hospital experiences at the front by a young Canadian V.A.D.

MACLEAN'S will be Twice-A-Month

starting February 1st, next year. An important point to remember. If you want to keep up with things nationally Canadian, you'll have to get the MACLEAN'S Twice-A-Month habit.

Over 70,000 Canadian Families Buy

MACLEAN'S

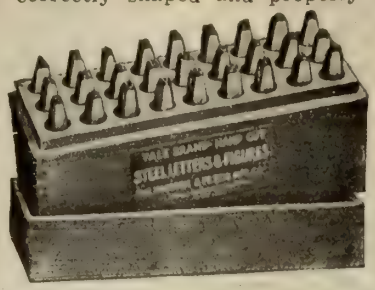
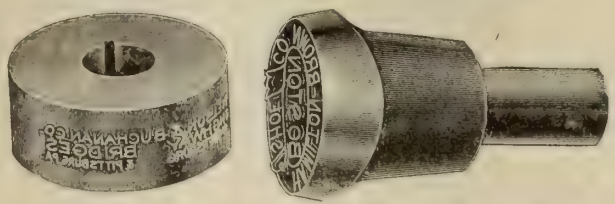
Hand Cut Steel Letters and Figures

The cutting and tempering make or spoil a stamp. Ours are correctly shaped and properly tempered.



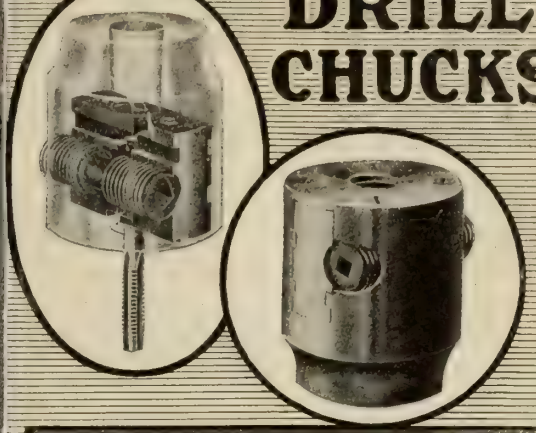
Marking Rolls and Machine Stamps



Estimates cheerfully given for Machine Stamps and Marking Rolls, complete or for cutting same only. Also for fancy lettering and special designs; stamps for difficult places and shapes.

The Hoggson & Pettis Mfg. Co.
New Haven, Connecticut, U.S.A.
Sold by GEO. F. FOSS MACHINERY & SUPPLY CO., LTD.
305 St. James Street, Montreal

SKINNER DRILL CHUCKS

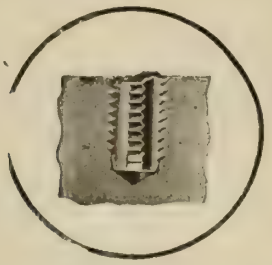


Built For Production—Not For Price

Skinner Drill Chucks—best for accurate work. These chucks will firmly hold drills or taps accurately on centre under the most difficult and continuous operating conditions.
The Jaws are correctly adjusted, tempered, hardened and accurately ground.

THE SKINNER CHUCK COMPANY
New Britain, Conn.

New York Office 91 Reade St.
San Francisco Office Rialto Bldg.
London Office 139 Queen Victoria St., London, E.C. 4



Take It Out

In two or three minutes—that broken tap buried in a costly forging. Without a mark on the forging, a scratch on the thread, take it out

With a

Walton Tap Fxtractor

as easily as you'd pull a cork from a pop bottle.

Fingers of the Walton Tap Extractor are made of special analysis steel. These fingers grip the grooves of the tap farther from the axis of the tap than is any solid portion of the tap itself; consequently greater leverage is in their favor, and it's a simple matter to back out the broken, buried tap.

Ask for particulars of 60-day trial offer.

The Walton Company, Hartford Conn.

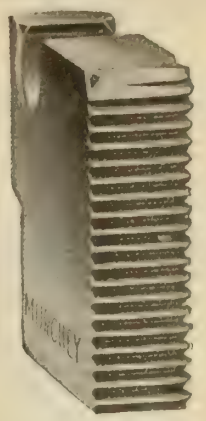
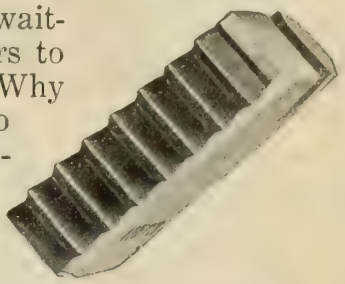
Murchey Chasers

Mean Quick Deliveries



Murchey Tools will cut your tapping and threading costs. **They will boost production 50%.** Another important feature is Murchey's **Quick Deliveries on Chasers.** This is a Murchey specialty. No waiting! We get your chasers to you when you want them. Why not use Murchey Tools to speed up your threading production?



Send for a Murchey Tap or Die on approval and give it a trial. You will then secure actual proof of its value to you.

Murchey Machine & Tool Company, Detroit, Mich.

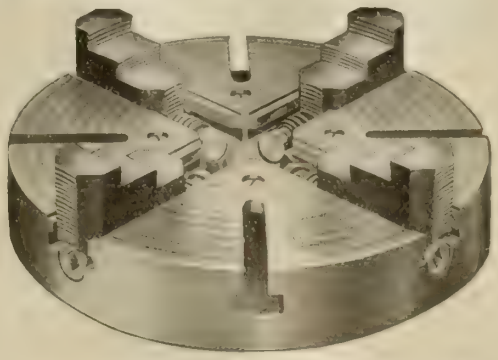
FENWICK FRERES AND CO., 15 Rue Fenelon, Paris, France

ALL STEEL

INDEPENDENT CHUCKS

are not an experiment—they have come to stay. They are a necessity with the modern machinery and high-speed steel cutting tools.



THE UNION STEEL BODY CHUCKS

are well designed and have all the elements of strength and durability for which they are designed. We make other types in steel also, including the Geared Scroll Chucks and the Geared Scroll Combination—all designed for heavy work and hard usage.

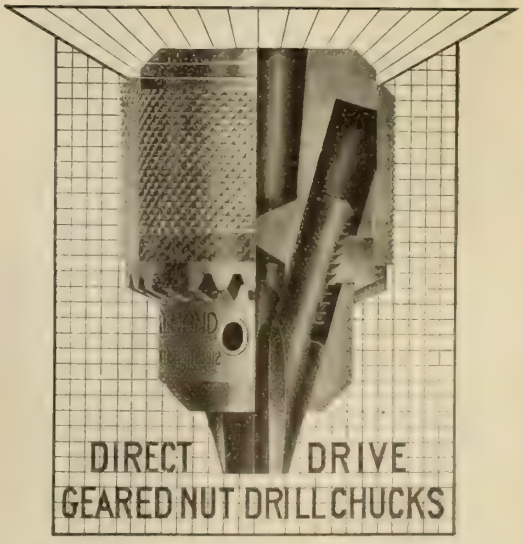
UNION MANUFACTURING COMPANY

New Britain, Conn.

New York Office: 26 Cortlandt Street

Makers of a complete line of chucks

ALMOND



TEETH cut on the nut giving DIRECT DRIVE and the hardened steel Pinion Bushings which prevent wear, insure long life.

OTHER ALMOND PRODUCTS

LATHE CHUCKS, RIGHT ANGLE TRANSMISSIONS, MICROMETER CALIPERS, FLEXIBLE STEEL TUBING

T. R. Almond Mfg. Co., Ashburnham, Mass.

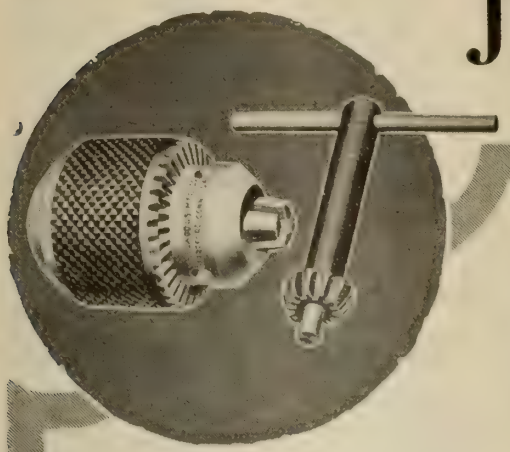
JACOBS CHUCKS

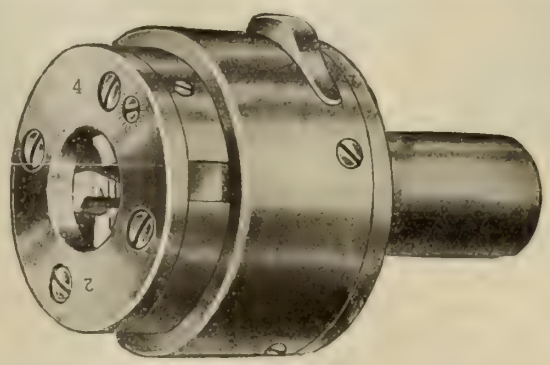


Jacobs Improved Drill Chucks do their part. They never disappoint the mechanic---no drill breakage ---no lost motion.

Equip all your machines with them.

ADDRESS DEPARTMENT C.M.

THE JACOBS MFG. CO. HARTFORD, CONNECTICUT, U.S.A.



H & G **Die Heads**

are of small outside diameter compared with the size of work they do.

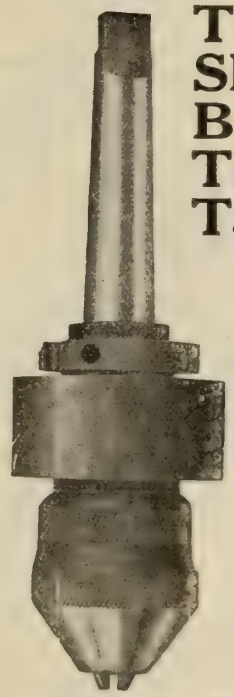
The H. & G. illustrated is an automatic, self-opening Die Head designed especially for use on Gridley and National Acme Multiple Spindle Screw Machines and others that use the die in a revolving position. The four sizes of this Head cut up to 9/16", 1", 1¼" and 1½".

All parts are hardened and ground and interchangeable. In a word—it's an H. & G.

Ask for Catalog

Eastern Machine Screw Corp.

New Haven, Conn., U.S.A.



The Saving Slip of the Bicknell-Thomas Tap Chuck

is its most important feature. Powerful enough to drive the tap under all ordinary conditions, the friction slips before enough strain can develop to break it. Compact — invaluable on multiple spindle machines. Adaptable — ideal for tapping blind holes.

Made in four sizes — from ⅛ to 1 inch taps. Straight or Morse taper shanks.

Let us send ths Circular

BUTTERFIELD

"The Paramount Line of Quality Tools"

When a skilled mechanic looks on the shank of a tool and sees the name "Butterfield" he is satisfied that he has been provided with a tool that will be equal to the most exacting work.

"Butterfield" Tools are accurately made of the best materials, their keen cutting qualities and durability is being proved in countless shops daily.

Drills, Taps, Dies, Reamers

Protect yourself by ordering "Butterfield" Taps, Dies and Reamers. Try them once and you will want them always.

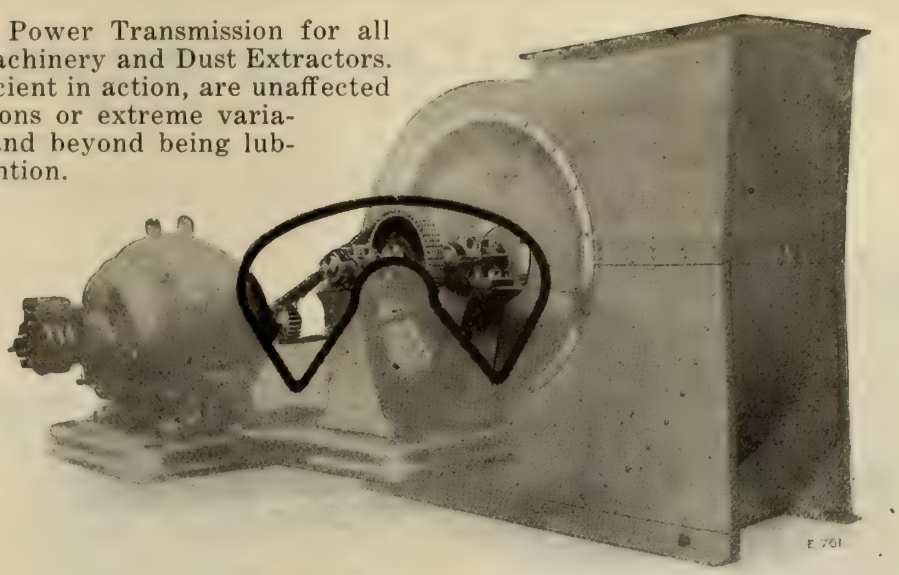
"The Coventry" Noiseless Chains

are the ideal form of Power Transmission for all kinds of Ventilating Machinery and Dust Extractors. They are silent and efficient in action, are unaffected by atmospheric conditions or extreme variations of temperature, and beyond being lubricated, require no attention.



A 25" Keith fan, driven by "The Coventry" Noiseless Chain Motor of 7½ h.p., running at 950 r.p.m., fan 400 r.p.m. This illustration shows how floor space is saved by using chain transmission.
